1. Problem statement

The proposed Final Project is part of the suite of applications for business management. This project will develop while we are at Erasmus period in Poland (Politechnika Opolska), so we take aim to improve the management of such centers in this country, since in many of these centers there is no computerized system. Trying to computerize this kind of centers has major advantages both for the users of the center and for workers and the organization's own site.

This project arises because we have seen the functioning of such organizations in both the private and the university and we felt we have a large degree of improvement.

To achieve the ultimate goal, we have defined a script to follow. First, before you start programming, we will make a list of functional and non functional requirements, develop a flow diagram (DFD) and model database. Once all this, we can begin to develop what will be the final application.

In developing the project we will use the development tool Windev. The following outlines the tools and how we will carry out the project.

- **Windev**

Windev, is an integrated development environment has been created by a French company PCSoft. The language used for programming Windev W-Language, is a 4th generation language, easy to use and very fast to program with it. WinDev has a GUI editor for creating graphical user interfaces using drag/drop.

- **Database.**

Our application will use a database to store all data of interest. The database engine will Windev provided to us, his name is **HiperFile**.

- **Microsoft Visio**

Before we start to develop our project, we will go through the design stage. At this stage, we will create the Data Flow Diagram (DFD). A DFD is simply a graphical representation of the "flow" of data through an information system.

or another stage in the design phase will be to create the Unified Modeling Language (UML). A UML is a graphical language for visualizing, specifying, constructing and documenting a system.

o To develop both DFD and UML use software Microsoft Visio that is for free for students in [MSDN Academic Alliance](#).

2. Functional requirements

2.1. Functional requirements list

Requirement	Explanation
Author :	Client
Requirement Number :	SCA – 1.0
Requirement Title :	Sign up activities
Requirement Text :	The system should allow the user to register the activities on offer
Requirement Type:	Functional

Requirement	Explanation
Author :	Client
Requirement Number :	SCA – 2.0
Requirement Title :	Reserve track/court
Requirement Text :	The system should allow the user to book a track or sports area that is available
Requirement Type:	Functional

Requirement	Explanation
Author :	Client
Requirement Number :	SCA – 3.0
Requirement Title :	Modify personal data (low level)
Requirement Text :	The system should allow the user to modify personal data like “password” for login in to the system.
Requirement Type:	Functional

Requirement	Explanation
Author :	Employer
Requirement Number :	SCA – 4.0
Requirement Title :	Activities info
Requirement Text :	The system should allow the employer see which activities are under its responsibility
Requirement Type:	Functional

Requirement	Explanation
Author :	Employer
Requirement Number :	SCA – 5.0
Requirement Title :	Timetable info
Requirement Text :	The system should allow the employer see his timetable of the actual week .
Requirement Type:	Functional

Requirement	Explanation
Author :	Department Manager
Requirement Number :	SCA – 6.0
Requirement Title :	Timetable management
Requirement Text :	The system should allow the department manager generate the timetable for all employers under his responsibility.
Requirement Type:	Functional

Requirement	Explanation
Author :	Department Manager
Requirement Number :	SCA – 7.0
Requirement Title :	Orders management
Requirement Text :	The system should allow the department manager make new orders of equipment for the sport areas.
Requirement Type:	Functional

Requirement	Explanation
Author :	Department Manager
Requirement Number :	SCA – 8.0
Requirement Title :	Activities management
Requirement Text :	The system should allow the department manager make new activities or modify already existing.
Requirement Type:	Functional

Requirement	Explanation
Author :	Administration
Requirement Number :	SCA – 9.0
Requirement Title :	Staff / Users Management
Requirement Text :	The system should allow the administration to hire/dismiss employers and add/delete users
Requirement Type:	Functional

Requirement	Explanation
Author :	Administration
Requirement Number :	SCA – 9.0
Requirement Title :	Economy Management
Requirement Text :	The system should allow the administration to generate entry and expenditures.
Requirement Type:	Functional

2.2. Functional Decomposition Diagram

The Functional Decomposition Diagram shows Sport center as the root of the system. It also displays the five main subsystems related to our project:Reserves, activities, economy, personal and area's process. Below each parent subsystem is the processes that it handles, such as make new reserve, auditory or personal management for example.

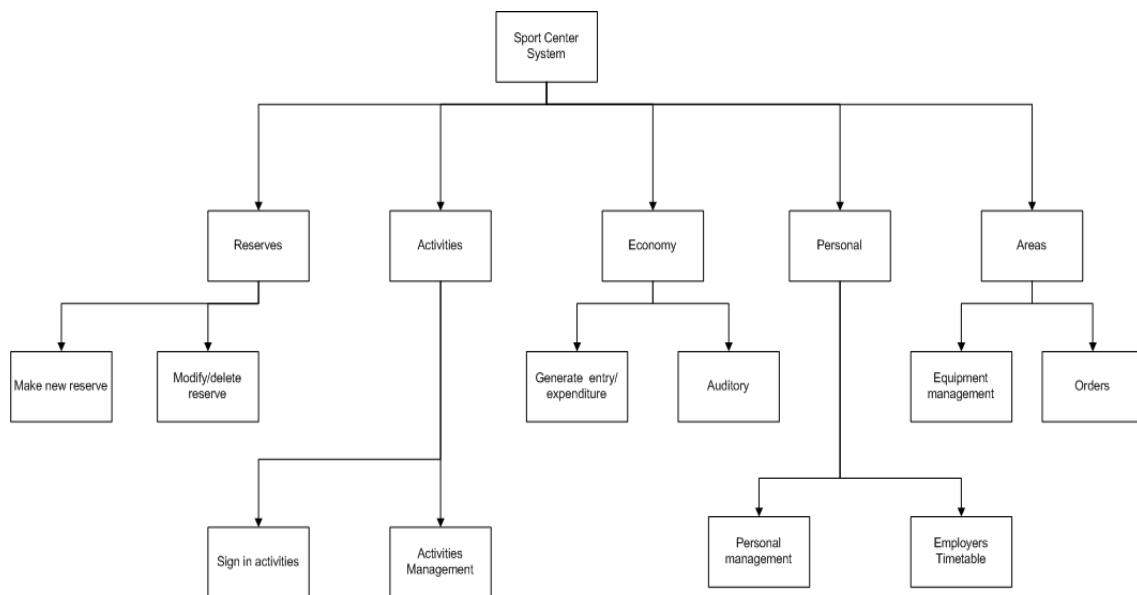

Figure 1 - Functional Decomposition Diagram

2.3. Partial Event Decomposition Diagram

The following Diagram describes the system in greater detail, describing the tasks performed in each process. For example, the personal Management process includes the tasks of add/delete new client/employer and modify employers/client data.

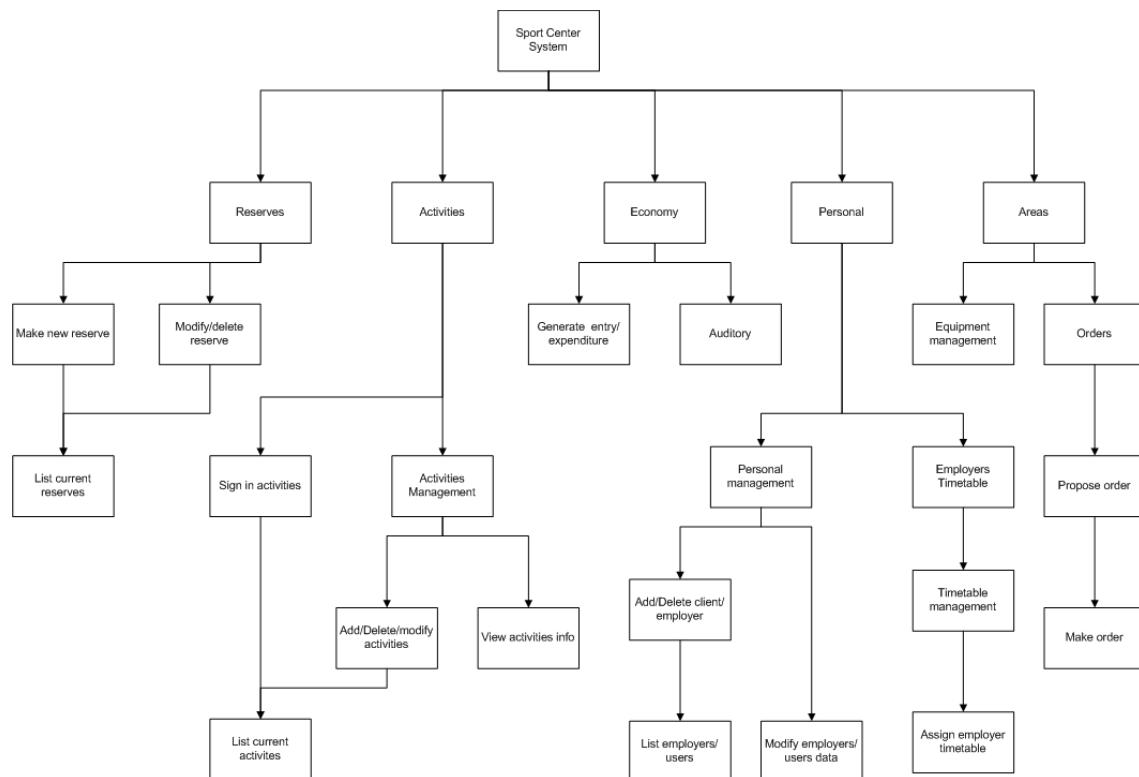

Figure 2 – Partial event Decomposition Diagram

3. Non-Functional requirements

- **Hardware Interface.**

The system can be managed from any personal computer. It doesn't need any special peripheral or extra protocol. That computer should be in the sport center enclosure.

- **Software Interface.**

This application is thinking for run in Windows operative system. It does not need any particular application for start to run, the only one thing that the user must to do is install our application with the installer that we give them.

4. Process Model (DFD)

4.1. Context Diagram

The following diagram shows the Sport Center System Context Diagram. The context diagram defines the scope and boundary for the system and the project.

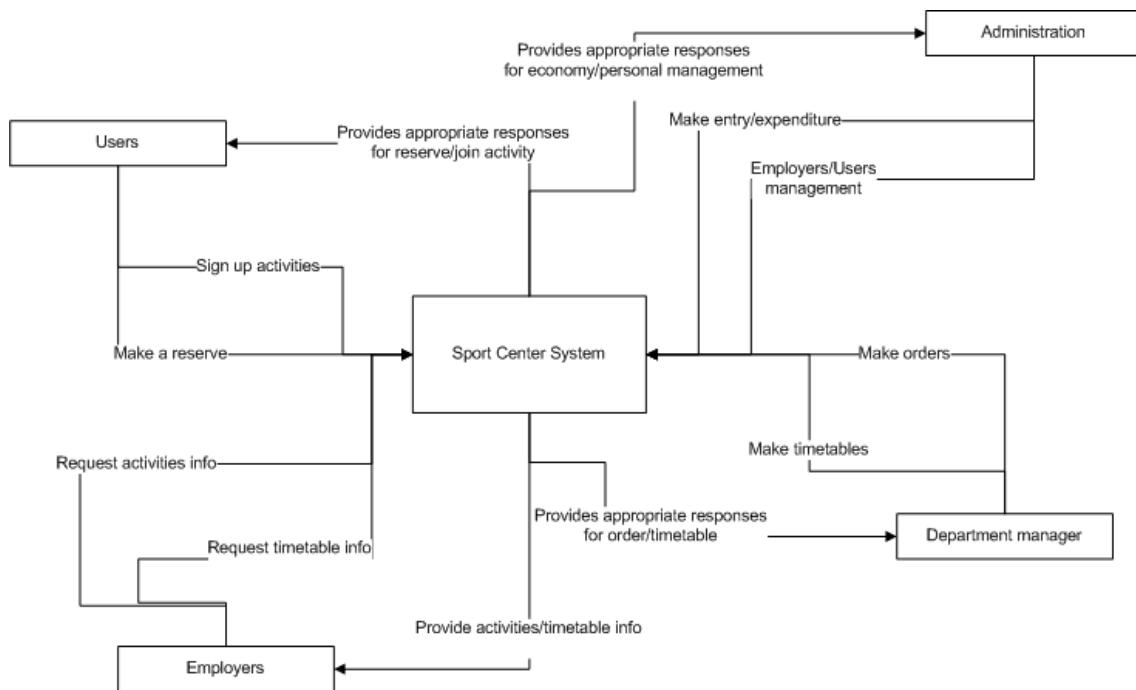

Figure 3 – Context Diagram

4.2 System DFD

The System Diagram for Sport Center System contains one principal processes/events and there are five external agents: Users(clients), employers, department manager, administration and super user (root).

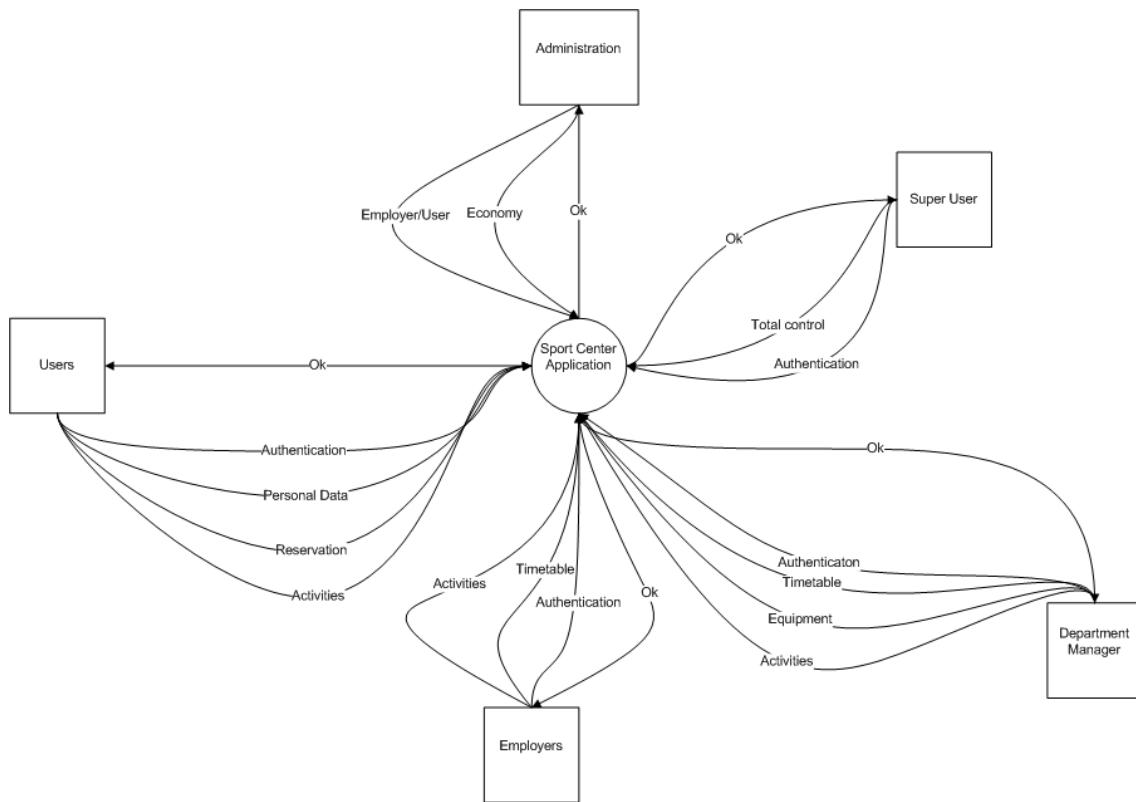

Figure 4 – System dfd

4.3. Lower level diagrams

4.3.1. DFD level 1

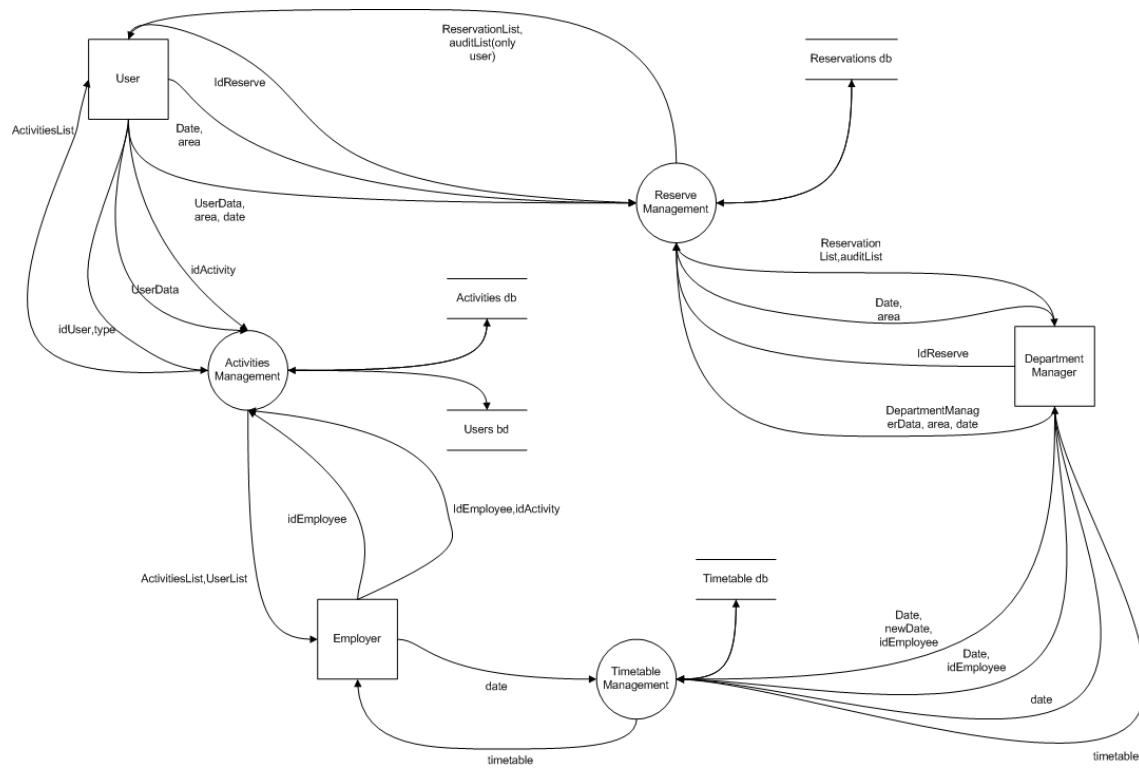

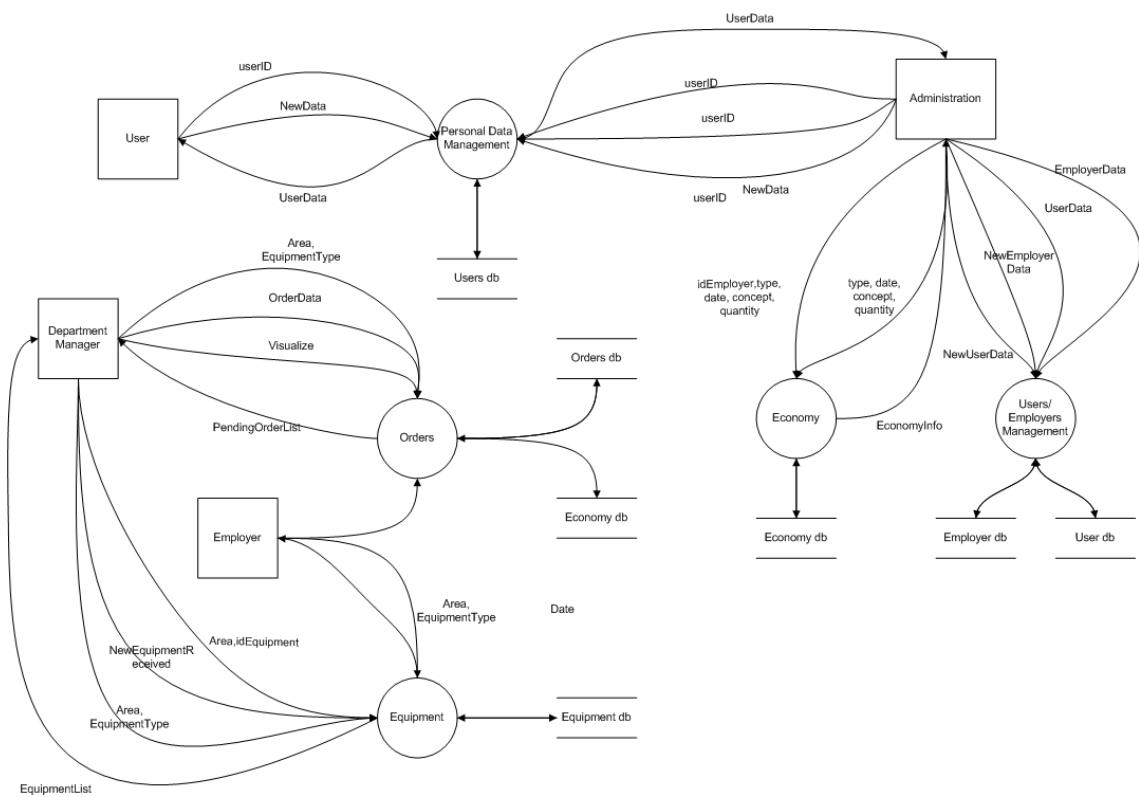

Figure 5 – dfd level 1

**Figure 6 – dfd level 1 part 2**

4.3.2. DFD level 2

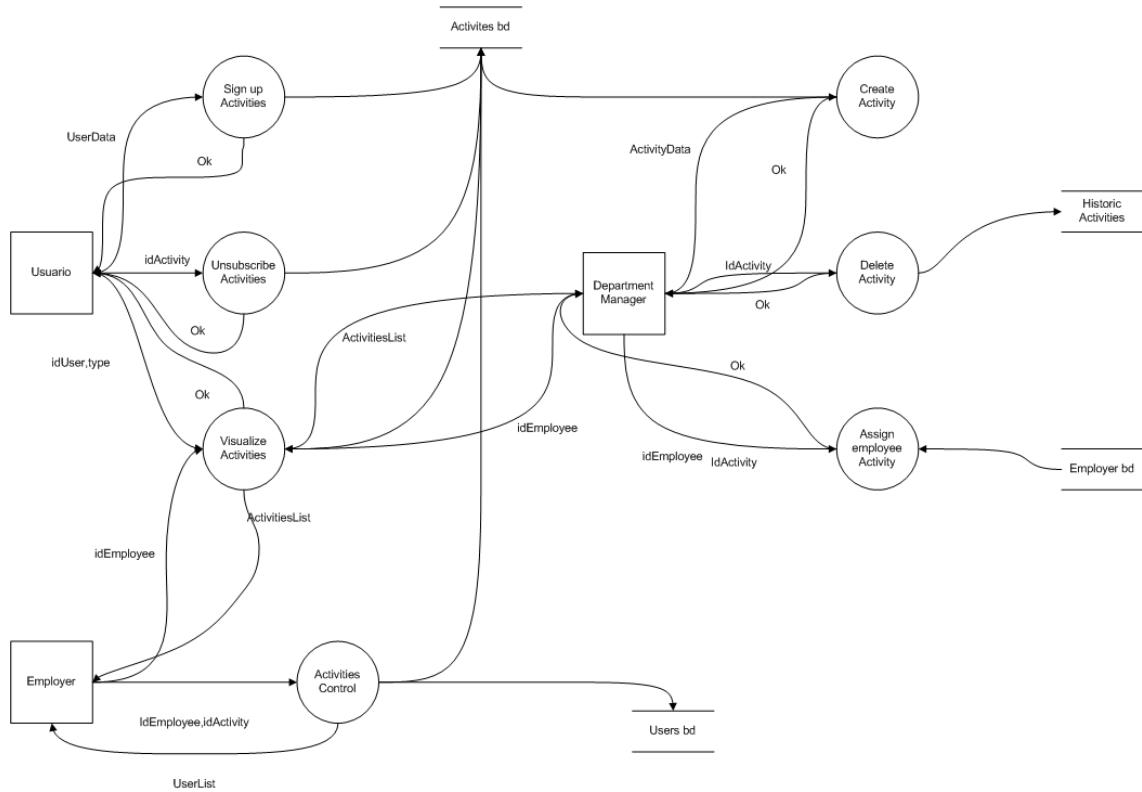

Figure 7 – activities dfd level 2

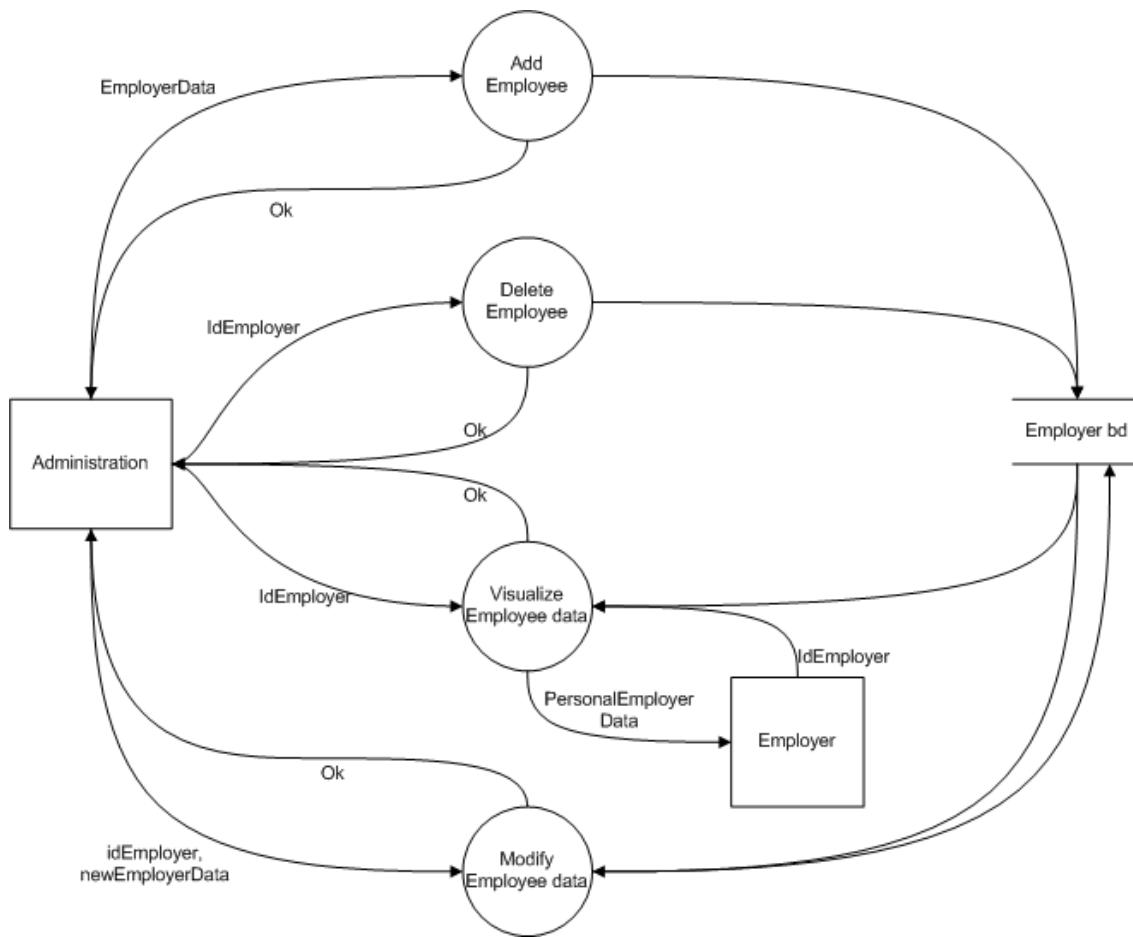

Figure 8 – administration dfd level 2

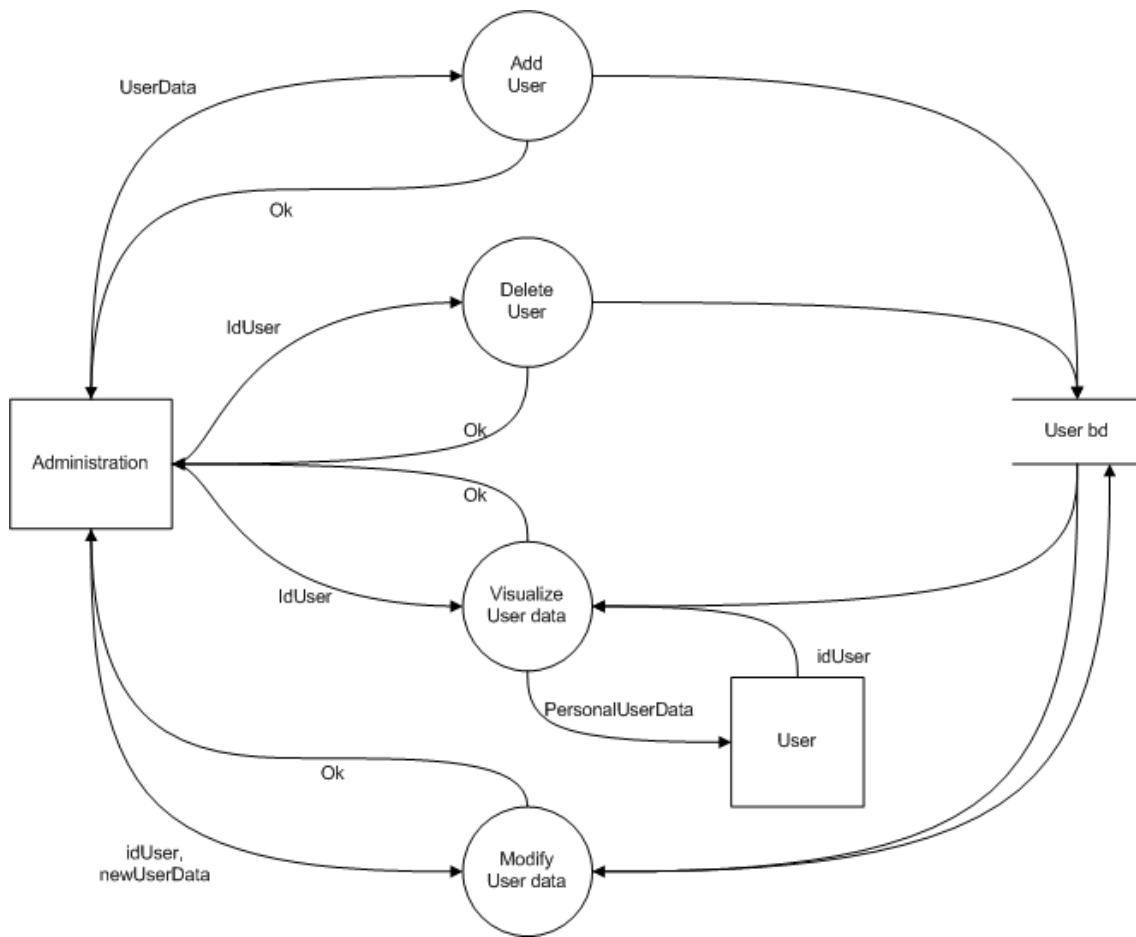

Figure 9 – administration dfd level 2

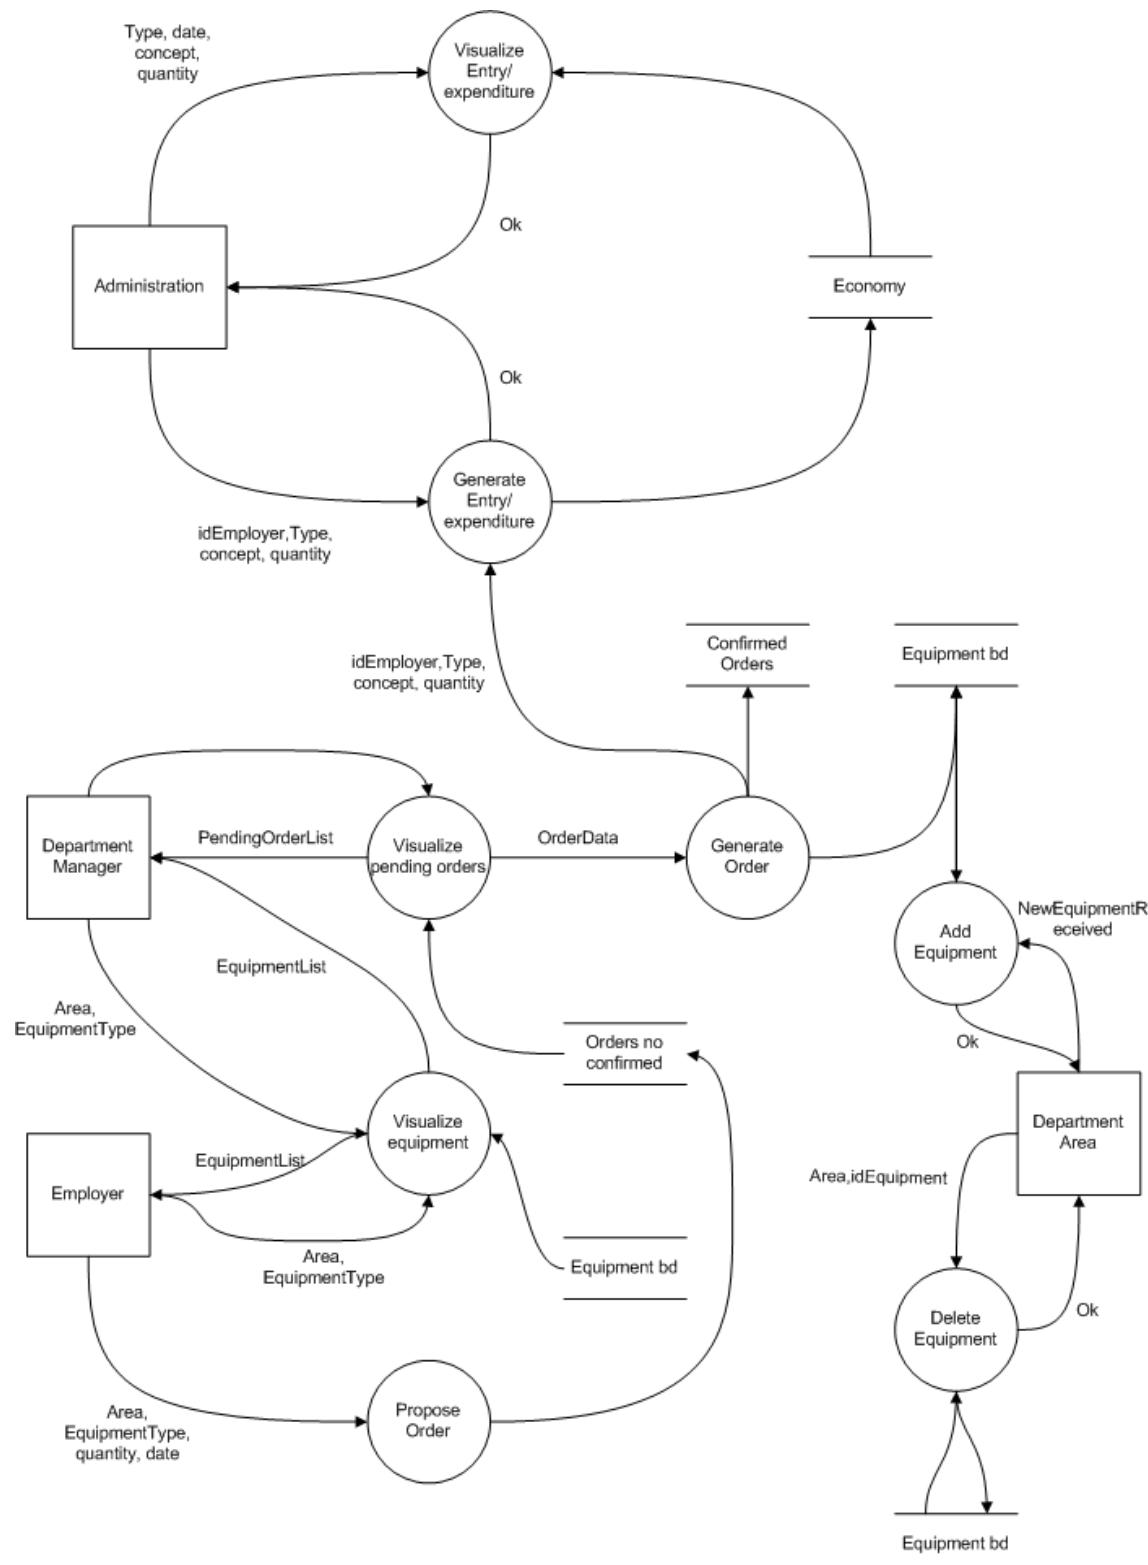

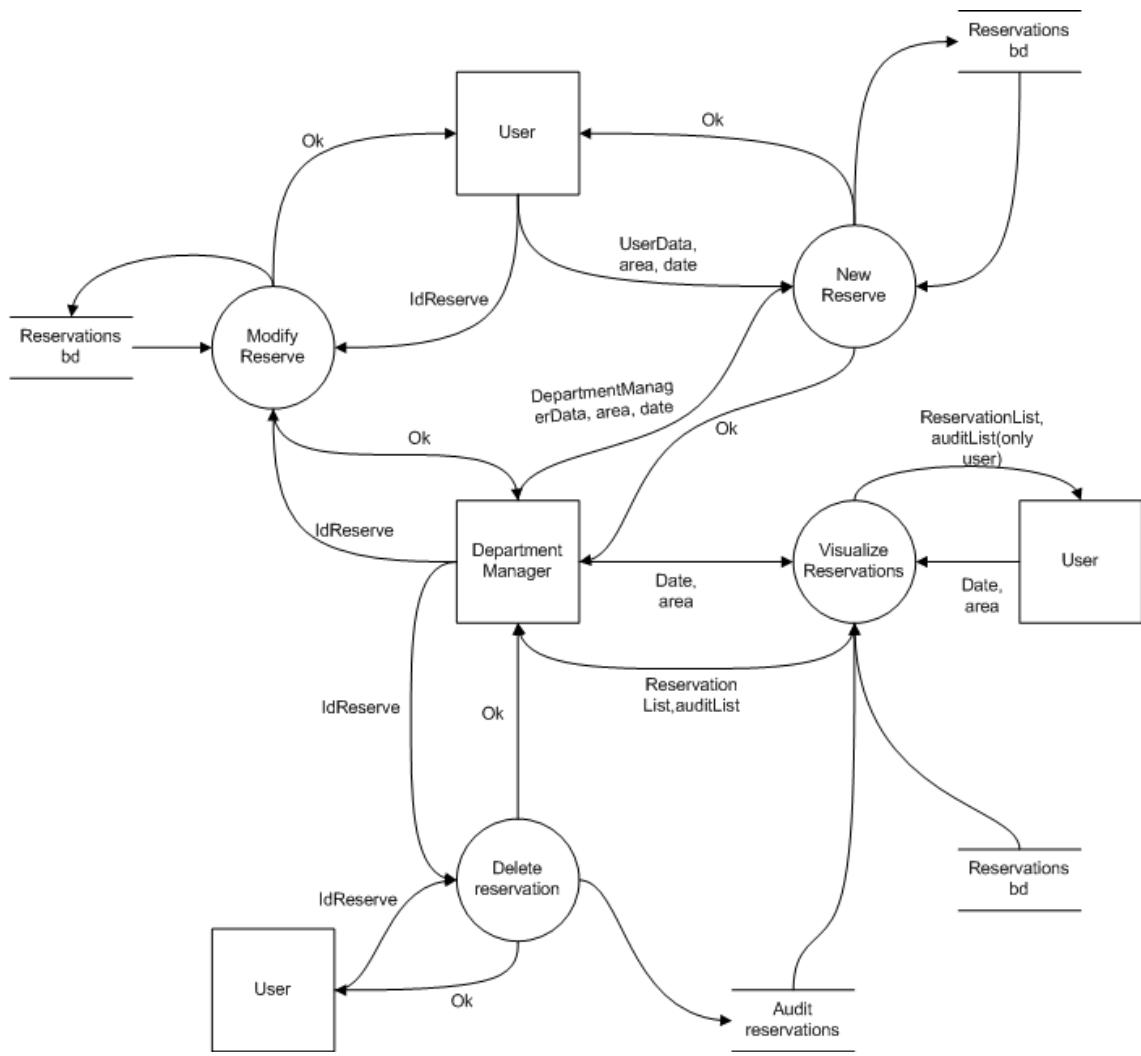

Figure 10 – administration dfd level 2

**Figure 11– reserves dfd level 2**

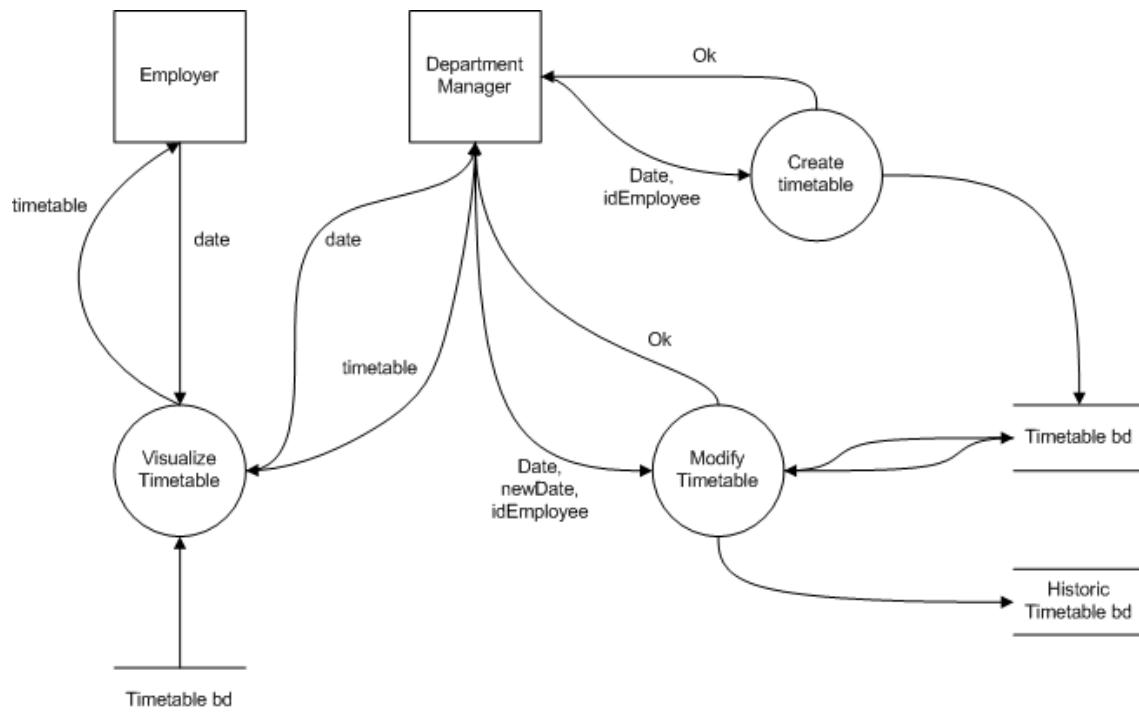

Figure 12 – timetable dfd level 2

5. Data Model (ERD)

5.1. Context Data Model

The Context Data Model for Sport Center system consists of the following entities: Client, Employer, Economy , Equipment , Reserves, Activities, Orders and their respective relational tables..

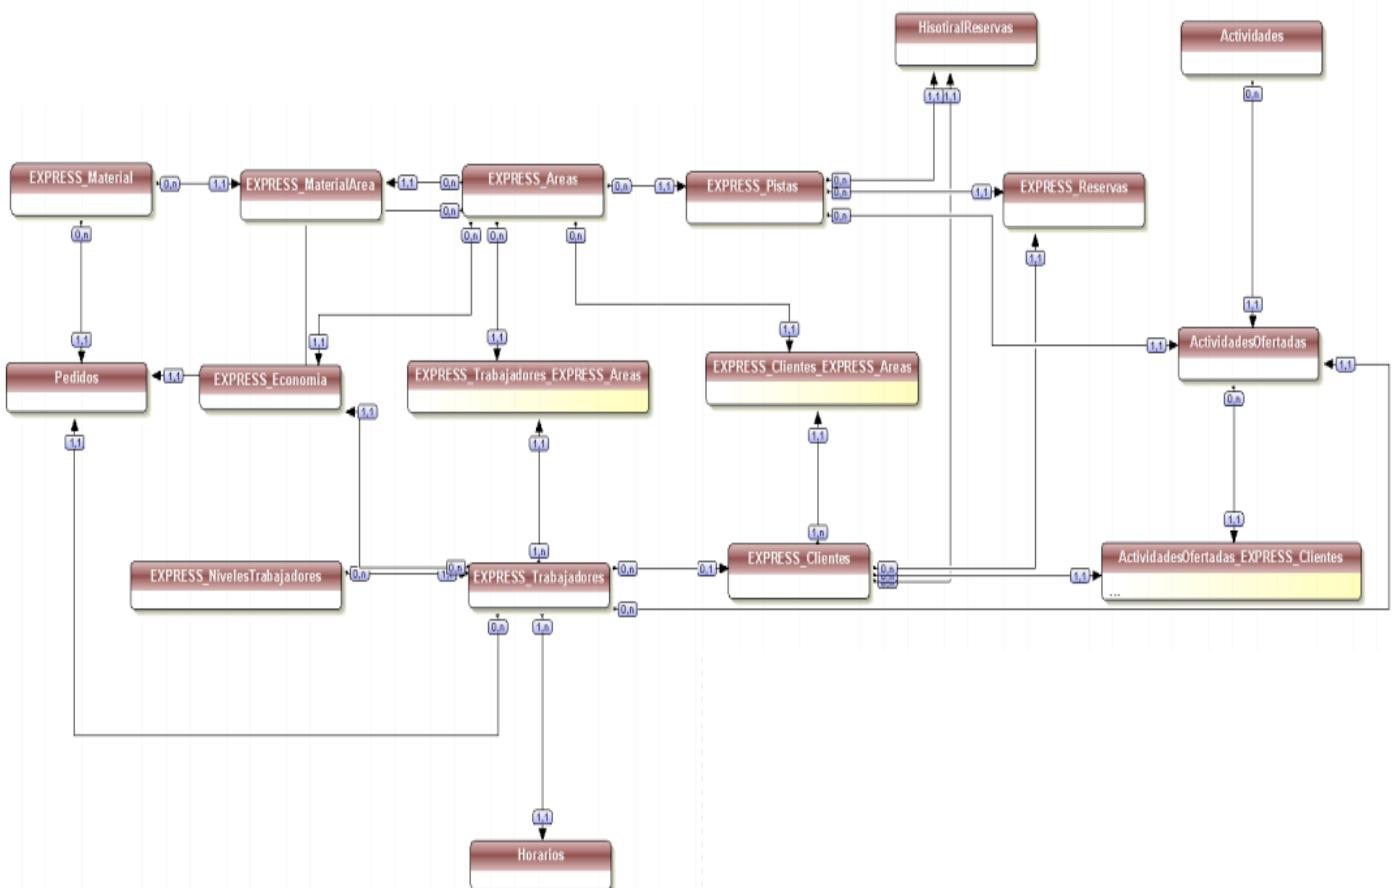

Figure 13 - Context Data Model

5.2. Complete Data Model

The Complete Data Model for Sport Center system consists of the same entities listed in the Context Data Model. However, this model contains all of the attributes associated with each entity. The following are the business rules for establishing each of the relationships:

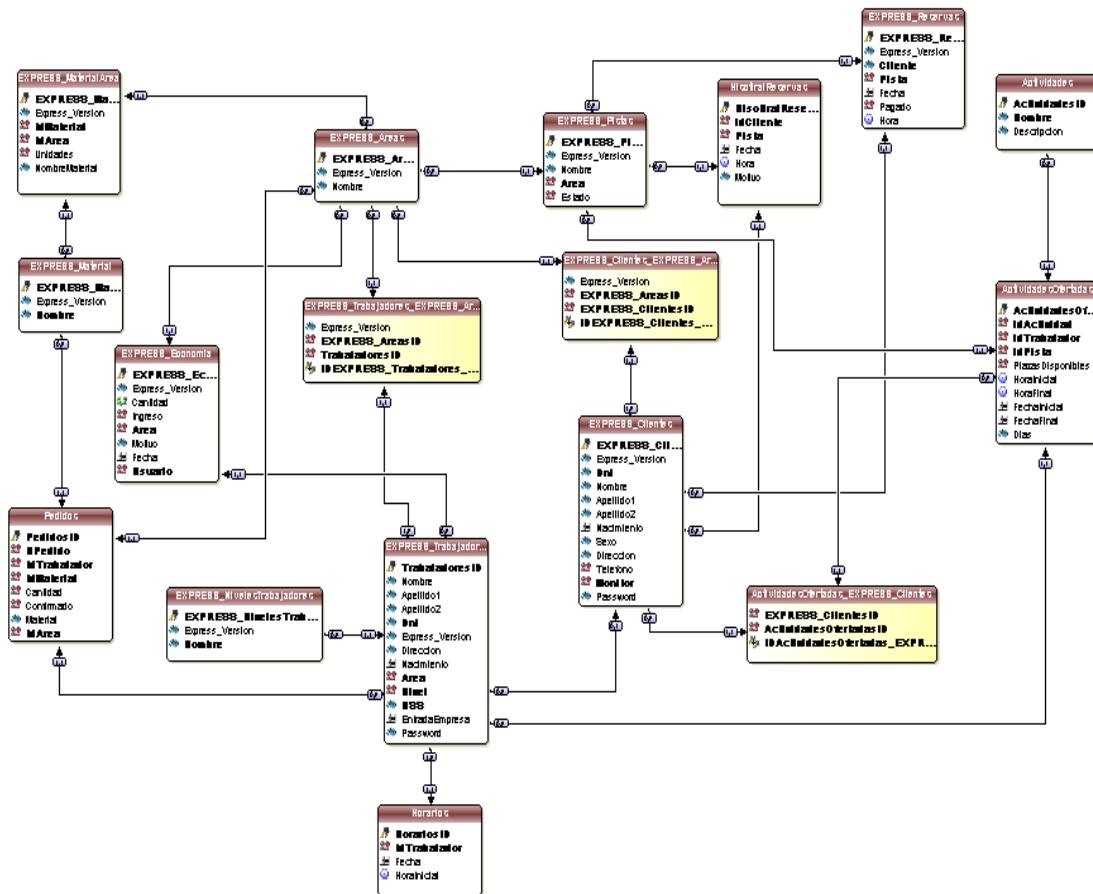

Figure 14 - Complete Data Model

7. Object oriented model

7.1 Use case diagram

7.1.1 Client diagram

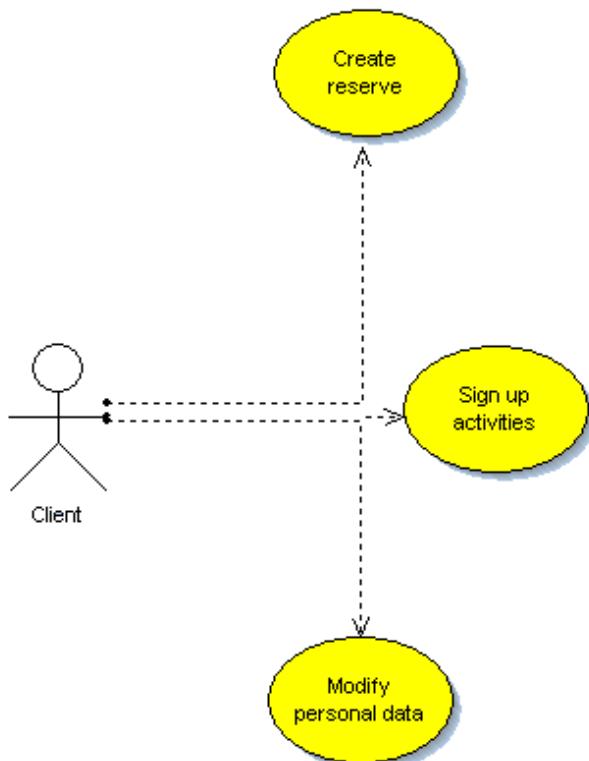

Figure 15 – Client user diagram

Use Case Name :	Create Reserve
Actors :	Client, Employer
Description :	<p>This use case describes the process of making a new reservation by a client. The client can choose an available area and choose a time, available also, for making his reservation. After that, the client should pay the reservation and that generates an entry.</p> <p>If the client wants to cancel the reservation, it's possible but he loses 25% of the price of the reservation.</p>

Use Case Name :	Sign up activities
Actors :	Client
Description :	<p>This use case describes the process of signing up in an activity by a client. The sport center offers a list of available activities. The client can choose all that he wants. If the client wants to cancel a reservation, it's possible. In the same way, if he signs up, there is an option to cancel this enrollment.</p>

Use Case Name :	Modify Personal data
Actors :	Client
Description :	This use case describes the process of the possibility of change some personal data like password or address. Client, alter login into system, can change their personal data.

7.1.2 Employer diagram

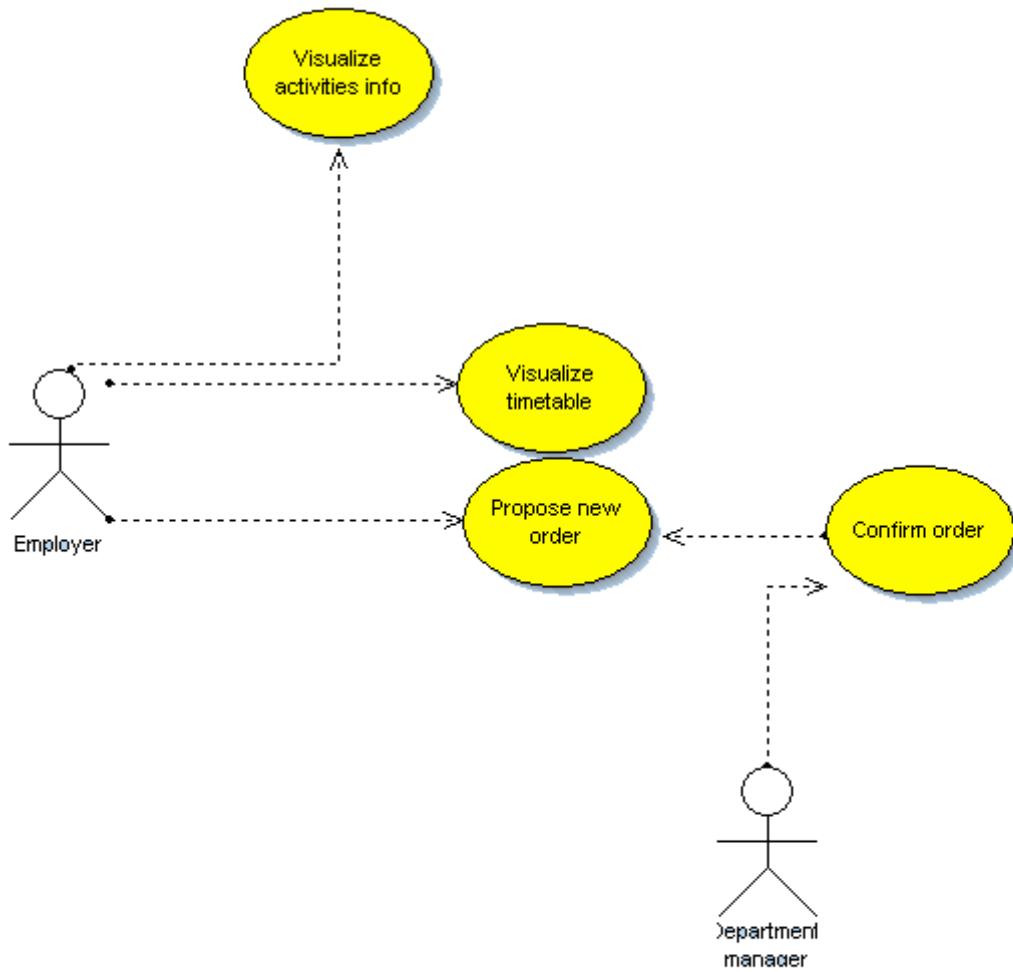

Figure 16 – employer user diagram

Use Case Name :	Visualize Activities info
Actors :	Employer, Department manager
Description :	This use case describes the process of show information about activities which employer it's the responsible. For example, he can look the timetable for these activities.

Use Case Name :	Visualize timetable
Actors :	Employer
Description :	This use case describes the process which an employer can look his timetable for the actual week

Use Case Name :	Propose new order
Actors :	Employer
Description :	This use case describes the process of order new equipment. He can add whatever items that he needs, and after that he should put prices for items which are requested. This order will have a status called "pending" until department manager confirm it.

7.1.3 Department Manager diagram

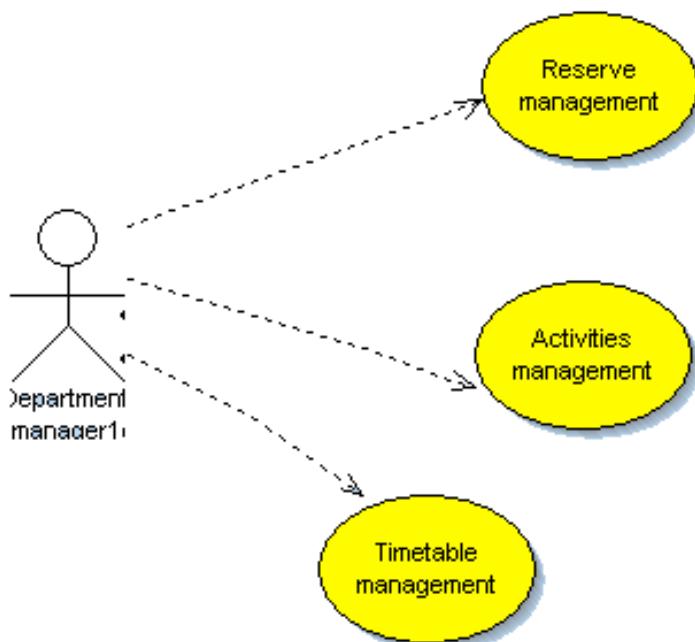

Figure 17– department manager user diagram

Use Case Name :	Confirm new order
Actors :	Department Manager
