4 Contributions

4.1 A stabilized augmented Lagrangian contact formulation ........ 25
  4.1.1 Contact kinematic variables .................................. 26
  4.1.2 Frictionless contact ............................................. 29
  4.1.3 Frictional contact ................................................ 33

4.2 Surface definition in cgFEM ....................................... 38

4.3 Towards robust, efficient solvers for non-linear problems based in cgFEM 41
  4.3.1 Control of the system ill-conditioning through a displacement-based stabilization ........................................... 41
  4.3.2 Improvement of the recovered stress field for contact problems 44

4.4 Application example: patient-specific dental implant simulation ..... 47

5 Closure

5.1 Summary ............................................................. 53

5.2 Future developments ................................................ 55
