Acknowledgements	iii
Abstract	iv
Contents	xvii
1 State of the art	1
1.1 Acoustic environment of the launch pad: noise sources . . . . .	3
1.2 Methods for noise mitigation at the launch pad . . . . .	10
1.3 Perfect sound absorption . . . . .	19
1.4 Aim of the work . . . . .	24
2 Preliminary results	27
2.1 Study of the acoustic environment of the VEGA launch pad . . . . .	27
2.2 Sonic crystals for noise reduction at the launch pad . . . . .	32

3 Transfer Matrix Method and critical coupling condition for acoustic waves	43
3.1 The Transfer Matrix Method . . . . .	44
3.2 Critical coupling condition. . . . .	50
3.3 Problem in transmission: Critical coupling condition in thin aluminum plates .	51
3.4 Problem in reflection: Critical coupling condition in Helmholtz resonators . .	63
3.5 Conclusions. . . . .	70
4 Experimental evidence of critical coupling condition for perfect absorption for a single frequency with Helmholtz resonators	73
4.1 Design and optimization of perfect absorbers . . . . .	74
4.2 Numerical model . . . . .	75
4.3 Experimental framework . . . . .	76
4.4 Results. . . . .	79
4.5 Conclusions. . . . .	81
5 Design of a finite distribution of Helmholtz resonators for broadband absorption	83
5.1 The Transfer Matrix Method for a multilayer system . . . . .	85
5.2 Insertion Loss in Reflection . . . . .	85
5.3 Design and optimization of the system. . . . .	86
5.4 Numerical analysis methods. . . . .	90
5.5 Manufacturing and set-up . . . . .	91
5.6 Results and discussion . . . . .	93
5.7 Conclusions. . . . .	98
6 Design of a bi-dimensional distribution of Helmholtz resonators for broadband absorption	99
6.1 Parametric study of finite size effects. . . . .	101
6.2 The diffusion coefficient. . . . .	104
6.3 Experimental framework . . . . .	106
6.4 Results and discussion . . . . .	108

6.5 Conclusions . . . . .	112
<b>7 Conclusions and future work</b>	<b>115</b>
7.1 Conclusions . . . . .	115
7.2 Future work . . . . .	117
<b>Bibliography</b>	<b>121</b>
