
Table of contents

Resum	i
Resumen	iv
Abstract	vii
Publications	xi
Table of Contents	1
1. General Introduction	5
1.1. Supramolecular chemistry	5
1.2. Molecular recognition	6
1.3. Nanotechnology: A step forward towards future molecular sensors	13
1.4. Organic-inorganic hybrid porous materials	15
1.4.1. Types of porous materials	17
1.4.1.1. Nanoporous anodic alumina	18
1.5. Gated materials	33
1.5.1. Sensing applications	42
1.5.2. Pathogens: Problems & perspectives	56
1.5.3. Food control. Bringing security to consumer	59
2. Objectives	63
3. A <i>Mycoplasma</i> genomic DNA probe using gated nanoporous anodic alumina	67
4. Aptamer-capped nanoporous anodic alumina for <i>Staphylococcus aureus</i> detection	89
5. Oligonucleotide-capped nanoporous anodic alumina biosensor for the rapid detection of <i>Candida auris</i> infection	113
6. Triplex hybridization-based nanosystem for the rapid screening of <i>Pneumocystis pneumonia</i> in clinical samples	147
7. A fluorogenic capped mesoporous aptasensor for gluten detection	179
8. Summary of Results and General Discussion	205
