Contents	i
List of Figures	v
List of Tables	xii
Nomenclature	xiii
1 Introduction	1
1.1 General scope of Internal Combustion Engines	3
1.2 Seeking the improvement of future generation spark-ignition engines	5
1.3 Thesis objective	7
1.4 Thesis outline	9
References	11
2 Fundamentals and literature review	13
2.1 Combustion in spark-ignition engines	13
2.2 Modern strategies for improving the efficiency of SI engines . .	19
2.2.1 Dilution strategies	19
2.2.2 Ignition systems	22
2.3 The pre-chamber ignition concept	25
2.3.1 General characteristics of pre-chamber combustion . .	26
2.3.2 Historical review of pre-chamber technology	28
2.4 Summary	40
References	43

3 Tools and methodology	55
3.1 Methodology outline	55
3.2 Experimental facilities and simplified numerical models	56
3.2.1 Test bench and engine characteristics	57
3.2.2 0D/1D engine model (GT-Power)	62
3.2.3 1D gaseous jet model (DICOM)	63
3.3 CFD model implementation	65
3.3.1 Description of the numerical model	65
3.3.2 Turbulence modelling framework	67
3.3.3 Combustion model description	71
3.3.4 Simulation methodology	76
3.3.5 Mesh independence study	82
3.3.6 Model validation	84
3.4 Summary	88
References	90
4 Characterization of the passive pre-chamber concept	99
4.1 Studies of the passive pre-chamber concept in un-diluted stoichiometric conditions	100
4.1.1 Analysis of the pre-chamber scavenge and flow field	100
4.1.2 Analysis of the combustion process	104
4.1.3 Energy balance of the pre-chamber during the ejection process	112
4.2 Impact of the engine operating conditions	114
4.2.1 Pre-chamber combustion features	114
4.2.2 Main chamber combustion features	119
4.2.3 Detailed study at low engine load/speed conditions: compatibility with catalyst warm-up	123
4.3 Impact of the pre-chamber geometry	130
4.3.1 Analysis of the pre-chamber A/V ratio	130
4.3.2 Impact of the pre-chamber volume	136
4.3.3 Impact of the number of holes	138
4.3.4 Impact of the tangential angle of the pre-chamber holes	140
4.3.5 CCV analysis using multi-cycle LES simulations of the pre-chamber combustion	144
4.4 Summary	154
References	158
5 Combination of the passive pre-chamber with dilution strategies	161

5.1	Characteristics of the passive pre-chamber combustion with air dilution	162
5.1.1	Study of the concept at lean conditions	164
5.1.2	Using hydrogen to overcome the air dilution limit	168
5.2	Characteristics of the passive pre-chamber combustion with EGR dilution	178
5.2.1	Study of the concept at different EGR levels	178
5.2.2	Issues of the passive pre-chamber concept with EGR . .	183
5.3	Summary	185
	References	188
6	Methodology for designing passive pre-chambers	189
6.1	Implementation of the methodology	190
6.1.1	General outline of the pre-chamber design process . .	190
6.1.2	Description of each phase of the methodology	191
6.2	Application of the methodology	193
6.2.1	Phase 1 results	193
6.2.2	Phase 2 results	196
6.2.3	Phase 3 results	204
6.2.4	Validation of the methodology	207
6.3	Summary	208
	References	211
7	Conclusions and future works	213
7.1	Scientific contributions of the research	213
7.1.1	Conclusions of the pre-chamber combustion	214
7.1.2	Conclusions of the main chamber combustion	214
7.1.3	Conclusions of the pre-chamber geometry features . .	215
7.1.4	Conclusions of the compatibility with other engine strategies	216
7.2	Practical application of the acquired knowledge	218
7.3	Guidelines for future investigations	219
	Global Bibliography	223
