Abstract	viii
Contents	xv
List of figures	xix
List of tables	xxi
1 Motivation and objectives	1
1.1 Motivation	1
1.2 Objectives	4
1.3 Outline	5
2 Simulation of interval dynamic systems	7
2.1 Modelling reality with Mathematics	7
2.2 Interval dynamic systems	11
2.2.1 Monte Carlo simulation	12
2.2.2 Guaranteed solution envelopes	13
2.2.3 Modal interval analysis	14
2.2.4 Region-based approaches	17
2.2.5 Trajectory-based approaches	19
2.2.6 Partition of the input space	22
3 Solution envelopes for parallel inputs models	25
3.1 Introduction	25
3.2 Parallel inputs model	26
3.3 Proposed method	28
3.4 Examples	29
3.4.1 Double-peak phenomenon	29
3.4.2 Subcutaneous insulin absorption	30
3.5 Discussion and conclusion	32
4 Solution envelopes for in-series model	35
4.1 Introduction	35
4.2 In-series models	36
4.3 Proposed method	37
4.4 Examples	41
4.4.1 Linear glucose model	41

4.4.2	Non-linear epidemiological <i>SIS</i> model	43
4.5	Discussion and conclusion	47
5	Solution envelopes based on cone monotonicity	49
5.1	Introduction	49
5.2	Cone monotonicity analysis	49
5.3	Proposed method	51
5.4	Example: non-linear chemostat model	55
5.5	Discussion and conclusion	57
6	Prediction of glucose concentration under variability	59
6.1	Introduction	59
6.2	Glucose-insulin model	60
6.2.1	The carbohydrate digestion and absorption system	60
6.2.2	The subcutaneous insulin absorption system	61
6.2.3	The insulin action system	61
6.2.4	The glucose metabolism system	61
6.3	Solution envelopes under parametric uncertainty	62
6.3.1	The carbohydrate digestion and absorption system	62
6.3.2	The subcutaneous insulin absorption system	63
6.3.3	The insulin action system	64
6.3.4	The glucose metabolism system	64
6.4	Results	67
6.4.1	Long-term glucose prediction	67
6.4.2	Short-term glucose prediction	69
6.5	Discussion and conclusion	70
7	Real-time estimation of plasma insulin concentration	73
7.1	Introduction	73
7.2	Extended Kalman filter	74
7.3	Real-time estimation of plasma insulin	75
7.3.1	Estimation from an insulin model	76
7.3.2	State observation of a glucose-insulin model	76
7.3.3	State observation of an extended model	77
7.4	Validation of insulin estimations	78
7.4.1	In-silico validation	78
7.4.2	Validation with real data	79
7.5	Results	80
7.5.1	Observability	80
7.5.2	In-silico results	80
7.5.3	Results with real data	82
7.6	Discussion and conclusion	83
	Conclusions of this thesis	87

List of Figures

2.1	Diagram of the glucose-insulin system	8
2.2	Diagram of the phenomenological insulin absorption model developed by Puckett and Lightfoot	9
2.3	Diagram of the behavioural insulin absorption model developed by Kraegen and Chisholm	10
2.4	Diagram of the two-channel insulin absorption model developed by Wilinska et al.	10
2.5	Set of possible solutions under interval uncertainty	11
2.6	Probability density function of the continuous uniform distribution	12
2.7	Diagram of proper and improper intervals	14
2.8	Diagram of inclusion and 'less than' relations	15
2.9	Diagram of lattice operators: Meet, Join, Max and Min	16
2.10	Representation of a priori and tight bounds	17
2.11	Representation of the wrapping effect	18
2.12	QR-factorisation method to reduce the wrapping effect	19
2.13	Examples of graph monotonicity analysis	21
2.14	Example of monotonicity in \mathbb{R}^2 for cooperative states	22
2.15	A partition of the non-monotone states of the set of initial state-space conditions in \mathbb{R}^2	22
3.1	Diagram of the parallel inputs model	26
3.2	Diagram of monotonicity of the parallel inputs model parameters	27
3.3	Diagram of one-compartment equivalent model	28
3.4	Improvements computing double-peak phenomenon bounds .	31
3.5	Diagram of the parallel inputs model for the Wilinska model . .	31
3.6	Diagram of the parallel inputs model for the extended Wilinska model	32
3.7	Improvements computing subcutaneous insulin absorption bounds with impulse bolus at $t_b = 50$	33
4.1	Diagram of a compartmental in-series model	36
4.2	Diagram of the linear glucose model developed by Cobelli et al.	41

4.3	Output bounds for the linear glucose model developed by Cobelli et al.	44
4.4	Diagram of the non-linear epidemiological <i>SIS</i> model without disease death rate	44
4.5	Improvements on the computation of bounds for the proportion of infected individuals	45
4.6	Improvements on the computation of bounds for the proportion of infected individuals considering a death by the disease rate	46
5.1	Under cone monotonicity, a single endpoint of the set of initial state-space conditions does not cover all the space. Example in \mathbb{R}^2	51
5.2	Under cone monotonicity, simulations considering the boundary of the set of initial state-space conditions cover all the set of initial state-space conditions. Example in \mathbb{R}^2	52
5.3	Under cone monotonicity, when the cone embraces an axis, that subset is reduced to a segment (1-dimension polytope) in \mathbb{R}^2	53
5.4	A partition of the boundary of the set of initial state-space conditions under cone monotonicity in \mathbb{R}^2	54
5.5	Computation of solution envelopes for a non-linear chemostat model	56
5.6	Computation of solution envelopes for a non-linear chemostat model	57
6.1	Diagram of the systems interaction	60
6.2	Parameters monotonicity of the carbohydrate digestion and absorption system	63
6.3	Parameters monotonicity of the subcutaneous insulin absorption system	64
6.4	Parameters monotonicity of the insulin action system	65
6.5	Parameters monotonicity of the glucose metabolism system	67
6.6	Solution envelope obtained for the first scenario	68
6.7	Solution envelope obtained for the second scenario	68
6.8	Solution envelope obtained for the third scenario	68
6.9	Solution envelope for 30-minute-ahead predictions with glucose measurements every 15 minutes	69
7.1	Diagram of the adjustment of uncertain parameters	78
7.2	Diagram of the adjustment of uncertain parameters	79
7.3	Example of in-silico estimations of plasma insulin concentration	81
7.4	Example of real data estimations of plasma insulin concentration	82

List of Tables

7.1	Results for in-silico estimation of plasma insulin concentration .	81
7.2	Results for real data estimation of plasma insulin concentration	83
7.3	Results for real data estimation of plasma insulin concentration (excluding the outlier patient)	83
