Justification, Objectives, Summary and Contributions	xiii
--	------

I Introduction	1
-----------------------	----------

1 State-of-the-art	3
---------------------------	----------

1.1 Batch processes	4
1.2 Batch process modeling	6
1.2.1 Knowledge-based models	7
1.2.2 Data-driven models	8
1.2.3 Hybrid models	9
1.3 Bilinear modeling cycle of batch processes	10
1.3.1 Data alignment	11
1.3.2 Data preprocessing	12
1.3.3 Bilinear modeling	14
1.3.4 Monitoring	21

2 Material and Methods	33
-------------------------------	-----------

2.1 Hardware	33
2.2 Software	33
2.3 Simulated Processes	33

II Preprocessing of Batch Data	39
---------------------------------------	-----------

3 Batch data equalization	41
----------------------------------	-----------

3.1 Introduction	42
3.2 Challenges in batch equalization	43
3.3 Equalization of variables within a batch	47
3.3.1 Discarding intermediate values	50
3.3.2 Estimating missing values	52
3.3.3 Rearranging data	59

3.4	Multi-rate system	61
3.5	Conclusions	66
4	Batch synchronization	69
4.1	Introduction	70
4.2	Synchronization approaches	72
4.2.1	Indicator Variable	74
4.2.2	Time Linear Expanding/Compressing	78
4.2.3	Dynamic Time Warping	81
4.3	Warping Information	94
4.4	Comparative study of the synchronization techniques	95
4.4.1	Effect of synchronization on the correlation structure	97
4.5	Conclusions	104
5	Relaxed Greedy Time Warping for BMSPC	107
5.1	Introduction	108
5.2	Relaxed Greedy Time Warping algorithm	109
5.2.1	Enhanced global constraints	110
5.2.2	The RGTW algorithm	112
5.2.3	Cross-validation for the estimation of the RGTW parameters	116
5.2.4	Trade-offs of RGTW and comparison with online DTW	118
5.3	Warping information for enhanced BMSPC	119
5.3.1	NOC warping information-based control charts	119
5.3.2	Fault classification procedures	121
5.4	Application of batch synchronization	125
5.4.1	Offline synchronization	126
5.4.2	Online synchronization	132
5.5	Use of warping information	137
5.5.1	NOC-WICC for process monitoring	140
5.5.2	Supervised faulty WICC	140
5.5.3	PLSDA-based classifier	144
5.5.4	SIMCA-based classifier	145
5.6	Conclusions	146
6	Batch synchronization in scenarios of multiple asynchronisms	151
6.1	Introduction	152
6.2	Multisynchro approach for batch synchronization	153
6.2.1	Asynchronism detection	155
6.2.2	Specific batch synchronization	157
6.3	Iterative batch synchronization/abnormalities detection procedure	161

6.4	Failure modes and complex nonlinear interactions	164
6.4.1	Failure modes of the asynchronism categorization . .	165
6.4.2	Failure modes of the iterative batch synchronization/abnormalities detection procedure	167
6.5	Material and methods	169
6.6	Results	172
6.6.1	Performance of synchronization based on DTW and Multisynchro	172
6.6.2	Synchronization of batches with equal duration . . .	179
6.7	Conclusions	183

III Modeling of Batch Process Data 185

7	Parameters stability on bilinear process modeling	187
7.1	Introduction	188
7.2	Material and methods	189
7.3	Effects of batch synchronization	193
7.4	Effect of the rearranging methods	199
7.4.1	Batch-wise unfolding	199
7.4.2	Variable-wise unfolding	203
7.4.3	Batch-dynamic unfolding	206
7.4.4	<i>K</i> -models	207
7.4.5	Adaptive hierarchical <i>K</i> -models	209
7.5	Conclusions	212
8	Implications of batch synchronization in process monitoring	215
8.1	Introduction	216
8.2	Material	218
8.3	Effects of asynchronisms in synchronization quality	223
8.4	Effects of synchronization in process monitoring	224
8.5	Conclusions	233

IV Application 235

9	Modeling process dynamics through multivariate models and control charts.	237
9.1	Introduction	238
9.2	Nature of data in continuous phosphorus removal processes	241
9.3	Batch modeling for continuous processes	243
9.4	Conclusions	255

10 MVBatch Toolbox for bilinear batch process modeling	257
10.1 Introduction	258
10.2 Modeling cycle of batch processes	259
10.2.1 Data alignment	259
10.2.2 Data modeling	259
10.2.3 Design of the monitoring scheme	261
10.3 Software specification and requirements	263
10.4 Data set	263
10.5 Description of the MVBatch Toolbox	264
10.5.1 Screening	265
10.5.2 Alignment	266
10.5.3 Modeling	276
10.5.4 Monitoring	285
10.6 Conclusions	290
V Conclusions	291
11 Conclusions	293
VI Appendices	309
A Projection methods to latent structures for BMSPC	319
A.1 Bilinear models	319
A.1.1 Principal Component Analysis	319
A.1.2 Partial Least Squares	321
A.1.3 Principal Component Regression	322
A.2 <i>N</i> -way modeling	323
A.2.1 Parallel Factor Analysis	323
A.2.2 Tucker-3	325
A.2.3 Other models	326
A.3 Selection of the number of principal components	326
A.4 On-line application of projection methods to latent structures	331
B Variance-covariance maps for process dynamics visualization	337
C Monitoring of multiple asynchronous batches	341
C.1 Synchronization and monitoring of NOC batches	342
C.2 Synchronization and monitoring of type I faulty batches	352
C.3 Synchronization and monitoring of type II faulty batches	362
C.4 Synchronization and monitoring of type III faulty batches	372
