Summaries
Castellano ................................................................. 1
Valencià ................................................................. 4
English ................................................................. 7

General Introduction .................................................. 11
Combination of physical and low-toxicity chemical postharvest treatments for integrated disease management of citrus fruit: a review

General Objectives .................................................. 47

Chapter 1 ................................................................. 51
Evaluation of sodium benzoate and other food additives for the control of citrus postharvest green and blue molds

Chapter 2 ................................................................. 79
Evaluation of brief potassium sorbate dips to control postharvest penicillium decay on major citrus species and cultivars

Chapter 3 ................................................................. 107
Potassium sorbate residue levels and persistence in citrus fruit as detected by a simple colorimetric method

Chapter 4 ................................................................. 127
Short exposure to high CO₂ and O₂ at curing temperature to control postharvest diseases of citrus fruit

Chapter 5 ................................................................. 147
Synergism between potassium sorbate dips and short gas exposures at curing temperatures for zero residue control of green and blue molds in citrus postharvest

Chapter 6 ................................................................. 159
Control of citrus postharvest decay by ammonia gas fumigation and its influence on the efficacy of the fungicide imazalil

Chapter 7 ................................................................. 191

Relative susceptibility of major commercial orange and mandarin cultivars to postharvest green and blue molds and its relationship with fruit quality attributes

Reference: Prepared for submission.

General Discussion ......................................................... 217

Conclusions ................................................................. 225
