1. ARCHITECTURAL PART

EXPLANATORY NOTES

1.1 INTRODUCTION:

The final thesis work consist of the constructive description of residencial and comercial building in Vilnius (Lithuania). This building is sited in St 12 S. Konarskio projected 9 floors (8 floors + attic floor), apartment blocks consists of three sections. Two of the blocks are in level 0.00 but one of them begin in level - 0.36.

The building address is catrastral 0101/0055: 34, Vilnius KV Plot of land with a unique number 0101-0055-0034. Irregular rectangular plot. Plot of land ownership, layout and form of property management / rental right belongs to "VILBRA".

The first floor is destined to commercial space. The floors between second floor and ninth floor are adapted for residencial use.

Each block has four houses in each floor, so the building has 90 apartments. It has not got underground floor.

Therefore, inside of the plot it has been built parking spaces. It has 90 residencial car parking places and 10 to commercial área.

The building is set back from neighboring plots at a distance to ensure that does not harm the rights of others.

The average height of the building from the top of the parapet is 29.60 m. Parking spaces are addressed within the plot and some parking spaces for future residents are less than 300 m.

The main entrance to the building is planned S.Konarskio g.

Is a residencial building designed in a quiet and comfortable place. Strategically convenient distance from the city center and other parts of the city.

Inside of the building is communicated vertically by stairs enclosed in a reinforced concrete box to provide stability to the whole. It includes one elevator for each section of the building.

-Plot's area: 4.470 m²

-Building area: 7124.16 m²

Pb: 788.78 m²

P1-P6: 813.98 m²

Ppenthouse: 806.78 m²

Engine room: 644.72 m²

TOTAL: 7124.16 m²

-Shape building area: 1110.0 m²

-Building height:

Roof: 31.50 m

Roofstop: 29.60 m

1.2 LOCATION:

This building is located in Konarskio Street in number 12. In Vilnius (Lithuania). It's a residential zone with a good accessibility and well connected with public transport. It is close to a large park, Vingio , and near the road E272. It has a lot social áreas like restaurants or hostels.

IMAGE 1. Aerial view general area of the building

Fig 1. Location plan and legend

Vilnius is the capital of Lithuania. The city has a population of 539.939. Lithuanian's climate is maritime – continental, due to Vilnius is sited in the east of Lithuania, the prevailing climate is the continental. It is characteristic of this type of climate seasonal temperatures differences, cold winters and warm summers.

1.3 FIELD:

The plot area is 4470 m². The building density is 25.2 %. The planned construction area is 1125 m² and the building area is 1110 m². Comprising 30% of green spaces .

The road access is via the Konarkio street which is two-way.

The building is close to a school, kindergarten, art school children, Volunteer secondary g. Rimi supermarket, Forum Cinemas (Double) cinema. It is inside of a parcel planted recreation area, playground and recreation area for the elderly population.

Determined according to the expected number of apartments -90 apartments (1 parking space / apartment) a total of 90 parking spaces in residential and commercial sleeps 10. Each parking space has 12.5 m². People with disabilities provided 4 places nearest to the entrance of the building (in 4% of the total demand of parking). It can parking 49 cars within the plot , and the remaining 51 parking spaces will be granted for residential applications boundaries of the site at a distance of 300m Vivulskis plot g.41.

1.4 DISTRIBUTION FLOORS:

The building , as already named above, is formed by three blocks. Comprising ground floor , seven floors and attic floor. All plants are for residential use , except for the ground floor which also has commercial use. It is a residential building and is designed with a greater share of residential premises (91.00 % of the total area of the building) , with shops on the type of cabin (9.00 % of the total area of the building). Residential facilities consist of a large part of the building (90 apartments).

Consists of four walls, two main length of 75,160 meters and two 16,600 m. The accesses are performed on the two principal . In each block ground floor, seven floors and attic floor. On each floor from the first to the last (not counting the attic) consist of four apartments for each block, so it has twelve apartments on each floor. Each apartment is provided with different number of rooms, but all of them have kitchen, a place for rest and one bathroom at least. Additionally, all of them have different area.

Table 1. *Floor areas*

APARTMENT №	TOTAL AREA (m2)
Ground floor	788.78
1F	813.98
2F	813.98
3F	813.98
4F	813.98
5F	813.98
6F	813.98
7F	813,98
8F	906.78
9F	644.72

BUILDING STRUCTURES

1.1 DESCRIPTION OF STRUCTURE:

- Dimension of the building plan: 75.160 x 16.600 m
- Administrative building a support frame type:
 - Drilled solid foundations: piles.
 - Bearing walls and monolithic reinforced concrete floor , except for the first floor , where the walls are monolithic .
 - Monolithic ceilings and roofing.

1.1.1 FOUNDATION

Because the surface is resistant to a considerable depth, the best type of foundation in this case is, on piles, as it is a type of deep foundation.

At the top of the pile one pile cap, which is the union of two stilts so that, working together is performed.

This foundation system is that the resist is able to absorb the loads transmitted through the building.

The piles are mainly vertical loads of the structure, this column load is transmitted to the batteries batteries capitalization. Batteries while working by friction with the ground, generating charges in the opposite direction of the column.

According to regulations, the type of concrete used is HA-25 (characteristic strength $f_{ck} = 25$ MPa) and the type of iron arms B400S (f_{yk} characteristic strength = 500 MPa)

The following image shows how this type of foundations according EHE.08 works.

Fig. 2 . Loads direction

Fig. 3 . Loads direction

1.1.2 WALLS

It is a brick building with bearing walls .
 Because no pillars in the building, the facade enclosure walls will be load-bearing walls . That is, having a structural function , supporting other structural elements. This decision was taken due to the pressure on the walls of the first floor.

Load bearing wall structure

In such structures , the vertical elements supporting the slab are the masonry walls , in this case Termoarcilla .

This structural system has two types of vertical elements:
 load bearing walls . Above them directly supports the slab.

They are perpendicular to the bearing walls and are required to withstand horizontal actions.

On load-bearing walls wrought supported. On the slab the walls of the upper floor are supported, and the process is repeated .

Wall elevator and stairs are also monolithic wall.

1.1.5 FLOOR/ SOIL

The floor of the balcony is formed by slip ceramic tiles, reinforced concrete, geotextile, panels of polystyrene foam (EPS), another geotextile, modified bituminous waterproofing, a layer of concrete to form the slope and the monolithic slab.

On height below 0.00, it is found a capillary sheet, a geotextile (hydroduct 220 *), extruded polystyrene foam, two layers of waterproof coating based on water for cement coating and repair wet surfaces, wich is a waterproof coating based on cement. Consumption : approx. 1.8 kg / m² / 1 mm, and monolithic grillage.

* Hydroduct 220

Drainage composite , consisting of a 10 mm thick drainage core , a geotextile high performance and high film strength backing . Designed to collect and transport water is recommended for use in foundation walls , retaining walls, bridge abutments , tunnels , earth structures with shelter and planters. It serves as a drainage composite and of course protection for all waterproofing membranes.

The ground floor is formed by stoneware tile, a layer of concrete HA-25 with steel, polystyrene modified (PE), polystyrene (XPS) as insulation waterproofing layer, compacted diatomite* and compacted land.

* Diatomite compacted: cream colored fine powder , used for the manufacture of coatings .

On the 9th floor , the floor is formed by ceramic tiles in romos with the exception of wetlands, wich coating is tiled, fine-grained sand reinforced, PE modified, anti- impact sound insulation, rock wool insulation, four centimetres of dry sand compact, another PE modified and the monolithic slab with its corresponding later painted

On the other floors (2,3,4,5,6,7 and 8) which we will call soil type, are formed by ceramic tiles in rooms with the exception of wetlands , which coating is tiled, a layer of fine-grained sand reinforced, PE modified, an anti - impact sound insulation, acoustic wool, four centimetres of dry sand compact, another PE modified and monolithic slab. The surface is painted.

1.1.6 FACADE

The facade consists of two different finishes:

1. Finish Clinker tilings adhered by thermal insulating heat with a mixture of corrosion -resistant armor (reinforcing mesh) .
2. Finishing plaster primer silicate quartz with a mixture of grid reinforcement and to prevent the corrosion.

Thermal and acoustic insulation material used is semi-hard rock wool . In order to provide light to the interior , along the facade we find large metal windows and some balconies .

SD1.

One type of wall is silicate plaster primer with a mixture of reinforcement corrosion network resist reinforced. Semi- hard rock wool attached with glue and safety pins. Silicate layer blocks (bricks) from the interior finish plaster mineral and posterior painting.

SD3

Clinker facade exterior finishes adhesive with a mixture of mesh reinforcement corrosion resistant armor. Semi-hard rockwool attached with glue and safety pins. Silicate blocks (bricks) side a wall covered with mineral plaster and posterior painting.

Facade of ground floor

Clinker facade exterior finishes adhesive with a mixture of mesh reinforcement corrosion resistant armor. Semi-hard rockwool attached with glue and safety pins. Monolithic wall covered with mineral plaster and posterior painting.

1.1.7 ROOF

Consists of 2 layers of fiber reinforced bituminoas polyester with gravel above on it. Solid rock wool and thermal insulation rockwool. To slope formation is used expanded clay. A vapor barrier of PE modified, the monolithic slab and posterior painting.

Roof deck

Clinker facade exterior finishes adhesive with a mixture of corrosion resistant armor and a reinforcing mesh. Semi-hard rockwool attached with glue and safety pins. Silicate blocks (bricks) side a wall covered with mineral plaster and posterior painting.

1.1.8 INSTALLATION

The building is connected to the communication network under the conditions of the engineering design of the city with the corresponding technical terms.

-Electricity:

All floors will have electrical cables of distribution and assembly, which are hidden. Will have low voltage networks, TV, telephone, internet.

- Heating and ventilation:

The right conditions of habitability in the building concerning climate control of instances of housing comes from urban infrastructures heating of Vilnius. Inside the floors the elements heat sinks will be radiators and will have a natural ventilation system.

- Water supply and sewerage:

Inner drainage of rain. The contractor must install a faucet rain on the roof with a protective grille for protection against entry of leaves.

Rain drainage elements - must be equipped with automatic activation of the heating cable. It must be heated all gutter walls are passing through the roof structure .

The water supply is from the street Konarskio.

Stormwater and sewage will be connected to the sewer.

The floors are equipped with hot and cold water and must have measuring devices. The hot-water meters should be protected anti-magnetically.

Pipes are of PVC. Pipes and fittings must be covered by insulation.

1.1.9 FIRE SAFETY

It must comply with established spanish regulations :

“Criteria for the interpretation and application of Basic Document of the Technical Building Code.”

“DB SI - Safety in case of fire”

Installing fire for dry column will be placed:

Dry column system is used in buildings over 25 m . height , for a more rapid intervention by the public forces of extinction. They are enforceable by order of the Ministry of Housing of 02/26/74 (BOE No 53 of 03.02.74) in buildings over 8 floors or on the ground whose height exceeds 25 meters.

The building has an alarm system with automatic fire. Fire doors of the building are designed with sealing washers and self-locking mechanisms. In

addition, a system designed to ventilate, heat detector and hand bells fire hazard. Smoke detectors are located on the roof, installed in accordance with the requirements of normative documents.

The building has sprinklers like fire alarm system and the alarm system is automatic.

In the apartments and commercial premises are found thermal and optical detectors of smoke.

On each floor, on the stairs, there are buttons for manual alarm and the corresponding alarms.

Doors:

EI₂ 30: separates the elevator landing

EI₂ 90: landing

EI₂ 30-C5: stairs separates the landing

Walls: EI 60.

You can access the building through the western part, in case of fire.

In the area outside the building, two underground hydrants installed in the water supply will be provided.

In the building installation comprises:

- Automatic smoke detector
- Indoor siren
- Alarm button to protection against fire
- Smoke detectors above the suspended ceiling
- Programmable Relay Module
- Power supply
- Electromagnetic valve

1.1.10 HEALTH CONDITIONS

The Spanish legislation is governed:

The building has been designed to meet all hygiene criteria according to the spanish rules of CTE - HS (technical building safety health code) .

Salubrity:

Health HS 1 Protection against moisture

HS 2 Collection and disposal of waste

HS 3 Indoor Air Quality

HS 4 Water supply

HS 5 Waste wáter

1.1.11 ENVIRONMENT

The building is designed completely to keep the environment clean. In order to improve the microclimate , soil and air pollution , under a series of measures :

1. Parking is on asphalt .

2. Garbage is collected in underground containers for collecting waste specialized delivery closed and cover waste management . Dumpsters at specific sites.

3. The water supply and sewerage construction , collection and management of rainwater addresses to connect to centralized urban networks.

1.1.12 INSOLATION

The Spanish legislation is governed:

Real Decree 1627/1997 of 24 October, which establishes: minimum safety and health rules in construction.

Annex IV. "Minimum health and safety provisions to be applied in Works"

a) The temperature in rest areas , local personnel guard , of the toilets , canteens and local First Aid must correspond to the particular purpose of such areas.

b) Windows , the openings of zenith lighting and glass partitions should allow Avoid Excessive heat stroke , taking into account the type of work and use of the premises.

1.1.13 DISABILITY NEEDS

The Spanish legislation is governed:

The building will be designed to meet the needs of people with disabilities , under the rules DB SUA.

Basic request SUA 9:

Accessibility:

"Access and use non-discriminatory , independent and secure buildings for people with disabilities will be provided ."

Disabled people can easily access the edificio because the ground floor is fully enabled, going into effect compliance the relevant regulations.

Inside the building there is an elevator who disabled people can access to different floors and have adequate parking spaces near the entrance, following compliance with the regulations.

1.1.14 LIFT AND MACHINERY

The building has three different elevators, situated one in each block. The maximum load of 1000 kg.

2. TECHNOLOGICAL CARDS

In this part we explain in detail three construction processes.

The three parts of the execution of the building are: monolithic slab, roof covering and foundation (piles).

2.1 TECHNOLOGICAL CARD I. INSTALLATION OF MONOLITHIC SLAB.

2.1.1 GENERAL DESCRIPTION

The horizontal structural part are solved with the same constructive system. Reinforced concrete slabs is the solution for the 9 floors. The thickness of the slabs is 230 mm except in last floor slab is 220mm of thick.

The steel consists of a network overlays (upper and lower) of $\varnothing 12S500/220/\varnothing 12S500/220$ bars arranged in two orthogonal directions.

Fig. 4 . Section with reinforced slab

The total area of concrete (8 flats of 1 ceiling) is 7124.16 m². This type of structural system has the advantage of simplicity of implementation , but has the problem of large own weight. There are alternatives to solve this problem by introducing lightening elements , in this case , you need not lighten .

2.1.2 DESCRIPTION OF TECHNOLOGY AND SEQUENCE OF WORKS:

The reinforced concrete building technique is the use of concrete reinforced with steel bars or meshes, called frames.

It is also possible to assemble it with fibers, as plastic fibers, glass fibers, steel fibers or combinations of steel bars with fibers depending on the requirements to which it is subjected.

In this case we use concrete reinforced with steel bars.

SEQUENCE OF WORKS:

1- Mark levels.

2- Formwork and propping-up.

Placement of props on wooden sleepers (wedges), which uniformly distributed load with wood boards that support on metal girders, forming rails.

Form surface should be higher than the surface of the slab to allow placement of the side that contain the concrete. They must be properly placed to prevent tipping during concreting.

The formwork should contain and support the fresh concrete until cured and retain the desired shape without deforming. It is bound to be rigid, durable, waterproof and clean.

3- Stakeout of slab elements.

4- Stakeout of gaps.

5- Placing armor, including waiting for stairs.

1) Lower reinforcement.

2) Lower reinforcement.

3) Superior reinforcement.

4) Superior reinforcement.

The reinforcement must be clean and secured to the formwork so that it remains stationary during the pouring of concrete and its compaction.

There must be a minimum distance between the different reinforcing bars, to allow for proper pouring of concrete between them, the width between the reinforcement and formwork, must also maintain a minimum, standardized separation for this space is filled with concrete without moving the reinforcement.

6- Separators.

7- Pouring, compaction of concrete in slab and vibrated.

The fresh concrete poured into the formwork must be made to occur by preventing segregation of the mixture. To do this, the maximum height of pouring concrete is one meter.

Is placed in layers of thin horizontal to allow good compacting. To achieve a concrete compacted and thus the elimination of gaps, is made vibrated. For a complete vibration resistant and dry concrete consistencies are used. The needle remains upright in the mass of fresh concrete, introduced at each level until the tip penetrates into the previous layer, taking care not to touch the reinforcement.

Please note:

The discharge must not be from a great height (maximum height of two meters free fall), making sure that your address is vertical. The concrete must be directed during pouring through ramps or other devices to prevent collision with the free form or reinforcement.

- The positioning is performed by horizontal layers allowing good compacting the mass (usually 20 to 30 cm, not exceeding 40 cm in the case of plain or reinforced concrete 60 cm concrete).
- In the concreting of inclined surfaces, fresh concrete has a tendency to run or slide down, especially under the effect of vibration. If the layer thickness and slope are large, you must use a superior formwork.

8- Concrete curing:

Curing is one of the most important operations in the process of laying, since a poorly executed curing can decrease the strength of concrete as well as increase the porosity of the dough favoring the entry of outside environment and reducing therefore , durability of the element. During setting and hardening the evaporative water loss can occur.

The methods that can be used for curing are several: cover the surface with plastic, burlap, direct irrigation ...

9- Removing of formwork and finishes:

Removing formwork is made when the concrete has reached a sufficient hardness. In normal portland usually a period of between 3 and 7 days.

Repair small holes or voids generally superficial surface defects. If these defects are large or resistant in critical areas may require partial or total demolition construction

2.1.3 HUMAN SAFETY

> Risks

- Damage to third parties.
- Derivatives of meteorology .
- Blows in the hand by the hammer .
- Rollovers of wooden pallets (planks, boards, pillars, belts, supports, etc.) during hoisting maneuvers plants .
- Falling of wood during take off the formwork.
- Fall of people at different levels.
- Fall of people at the same level. - Cuts using hand saws.
- Stepping on sharp objects.
- Electrocution by canceling grounding of electrical machinery.
- Overexertion by poor posture .
- Blows to general objects.

- Dermatitis contact with cement.
- Derivatives of works on wet surfaces.

➤ Preventive Measures

- All operators have to have previous knowledge for the work described above.
- Access suitable to get to work.
- It is forbidden to do inappropriate things with the plates of the formwork. No operator can stay on it.
- Carry out concreting and vibrating of concrete in work platform.
- If it is necessary to concrete at night, it has to put lighting to make the works.
- To prevent falls from height, until formwork floor does not have perimeter protections of slab, the operators have to wear all individual protections. Phase of supervised work. It is recommended to walk resting your feet on the connections, avoid very warped boards.
- Use ladders auxiliary means to get on and off as needed.
- Remove nails or spikes of wood that was used.
- When you have to remove the boards, do it in an area that is already without formwork.
- Order and cleanliness in the execution of works. Remove debris and disposal of these to avoid accumulation.
- Correct stockpile of materials.
- To prevent falls from heights, banned the work without adequate protections.
- Installation of appropriate signals to risks.
- Prohibited the presence of operators where there is risk to lifting operations of different materials.
- Workers who handle the machinery must be specialized in this work.
- Operator specialist who directs the handling, assembly and disassembly of concrete pump pipe.
- Hose pouring concrete using two minimum operators.

➤ Signage

- Prohibition sign: prohibited certain conduct.
- Mandatory sign: forced certain behavior
- Warning sign: Warning of a certain behavior.
- Signs relating to firefighting equipment.
- Signs of rescue or relief.
- Light and acoustic signals.
- Risk of falling, shocks, bumps.
- Traffic routes.
- Storage areas for dangerous substances and preparations.
- Emergency situations.
- Dangerous maneuvers.

➤ Collective protections

- Safety nets .
- Resistant railing 90 cm minimum on each floor height , will have

- handrails, a interim and baseboard .
- Horizontal networks to protect gaps.
- Safety harness all workers, lifeline.
- Pathways and ramps in the same or different level.

> Individual protections

- Approved safety helmet .
- Costumes for rainy weather.
- Safety footwear .
- Protective footwear .
- Seat belts
- Bright and reflective vests .
- Reinforced leather gloves .
- Mask auto- filter .
- Harness anti - falls for work at height .
- Acoustic Protector.
- Glasses antiparticles or anti - projected screen.

Laboral risks	Consequence	Probability	Risk level
Blows and cuts by objects and tools	SERIOUS	AVERGAE	MODERATE
Entrapment for objects during loading and unloading operations	VERY SERIOUS	LOW	MODERATE
Entrapment by or between objects during assembly operations armor	VERY SERIOUS	AVERAGE	IMPORTANT
Fall of people at the same level	SERIOUS	AVERAGE	MODERATE
Fall of people at different levels in depth	VERY SERIOUS	AVERAGE	IMPORTANT

Table 2. *Main risks in working with rebar*

2.1.4 MATERIAL- TECHNICAL RESOURCES

- Materials:
 - Concrete (Cement , water , steel, fine aggregate and coarse aggregate)
 - Steel reinforcement .
 - Separators .
 - Caisson .
 - Wooden wedges .
 - Props .
 - Nails .
 - Pallets .

- Aids :
 - Ladder .

- Equipment:
 - Concrete mixer truck.
 - Vibrator electric needle.
 - Cutting Circular Saw
 - Radial electric motor.

- Tools:
 - Hammer
 - Pliers
 - Level

Table 2 . Resources of Materials – Aids – Equipment – Tools

MATERIALS	UNIT	QUANTITY
Concrete	M ³	187.22
Steel reinforcement	kg	17907.56
Separators	units	3255
Wooden wedges	M ²	1256.62
Props	M ²	895.2
Nails	unit	1871
Pallets	M ²	895.2
AIDS		
Ladder	unit	2
EQUIPMENT		
Concrete mixer truck	unit	2
Vibrator electric needle	unit	2
Cutting circular saw	unit	2
Radial electric motor	unit	2
TOOLS		
Hammer	unit	12
Pliers	unit	6
Level	unit	6

2.1.4.1 PLACEMENT EQUIPMENT

Concrete mixer truck

- Concrete mounted on truck chassis.
- Capacity of 6 m3.
- Machined at the top rear from the kneading load of the plant .
- Kneading during transport by the turn of mixing drum .
- Emptying the back bottom of the direction of rotation of cube and gutter height adjustable and swiveling 180 degrees inversion .

Pump truck

- Receive the concrete in the hopper from the truck mixer .
- Location timely work.
- Operation diesel engine.
- Efficiency: 80 m3 / hour
- Scope: 32 m .
- Parties:
 - Truck.
 - Hopper.
 - Pump

- Hydraulic arm with pipe.

The transport of the concrete will be with truck and it will be placed with concrete pump.

Manufacture of concrete:

In the preparation and application of concrete will fulfill the general requirements of Structural Concrete (EHE-08) REAL DECRETO 2661/1998 of 11-DIC, the Ministry of Development. The arids, water and cement will have to be automatically dosed by weight.

Tolerances in dosage will be two percent for water and cement, five percent for the various sizes of aggregates and two percent for the total aggregate. On the consistency of the concrete will allow a tolerance of twenty millimeters measured with the Abrams cone. The instalation of concrete will be able to make regular and explicit mixing of the components by providing a consistency and color uniform concrete. In the concrete mixer truck shall be placed a plaque, which bears the capacity and speed in revolution by minute recommended by the manufacturer, which should never surpass.

Before inserting the cement and aggregates in the mixer, it will be loaded of a portion of the amount of water required by the mass completing the dosage of this element in a period of time which shall not be less than five seconds or more than a third of the mixing time, counted from the time the cement and aggregates have been introduced into the mixer. Before returning to reload the concrete mixer truck it will be completely empty of contents.

Will not be allowed to return to knead in any case concretes already hardened in part, although further quantities of cement, aggregates and water are added.

Transport of concrete:

- The transportation from the mixer will be held as quickly as possible. The concrete must be prevented drying during transportation.
- Shall not be placed in concrete work with a principle of hardening or any alteration.
- The truck must be equipped with a stirrer.
- Curing is done keeping moist surfaces of the pieces until 70% of its strength.
- During transport, should be segregated coarse aggregate, resulting in the loss of homogeneity and concrete strength. Avoid vibrations and shocks as well as an excess of water, which promote segregation.
- If upon arrival at the pit concrete placement initially accused of setting, the dough should be discarded and not placing.

Pump conditions:

- Pumped concrete requires a cement content not less than 300 kg/m³ and use sand and coarse aggregate other than crushed.
- The dosage of the concrete must be done by weight. You should use a plasticizer or free flowing and use soft-plastic consistencies. Appropriate to the use of pozzolanic cement, the plasticity conferred by the concrete.
- The maximum aggregate size should not exceed 1/4 the diameter of the pipe if it is metallic, or 1/3 if plastic.
- Not be used aluminum pipe.
- The placement should be avoided direct projection of the jet of concrete against armor, you have to monitor that the concrete does not appear segregated because of compressed air, and precautions should be taken with regard to operator safety.

Fig 5. *Placement equipment.*

 4. PUMP TRUCK

2.1.5 ORGANIZATION OF WORKS

* FOR EXAMPLE, IN CASE OF SECOND SLAB:

$$813,98 \text{ m}^2 \times 0,23 \text{ m of slab} = 187,22 \text{ m}^3$$

One concrete mixer truck : 6 m³ and need 15 minuts to empty with pump truck.

Therefore , in one day it is possible concreting of the entire plant , and are needed about 11 hours.

Putzmeister has been chosen 32X -150 pump. With a vertical reach of 32 meters and boom :

Length of the first section: 7.7 m

Length of the second section: 7.05 m

Length of the third section: 7.05 m

The fourth section length : 6.2 m

Since we have 75.730 m length of slab , and the maximum range of the arm is 32 m, 3 trucks pump for the entire slab is needed.

Fig. 6 . Pump truck

Fig. 7 . Concrete mixer trucks

2.1.6 QUALITY CONTROL

The testing of concrete is done in their two states to meet their fresh and hardened properties to determine their qualities and strength. The behavior of concrete against the various efforts is variable and complex.

Minimum tests to make and frequency of realization

Tests shall be :

- During the execution of structures, often as it indicated below or when the Project Management orders.

Sampling of fresh concrete , will be held at the time and place of placing concrete in the formwork , under the conditions that the EHE -08 is established.

- After the execution of structures, when necessary verify the results of tests conducted on molded specimens.

The tests were performed on extracted witnessed by rotary probe structures.

1. Tests to be performed on fresh concrete

1.1 Cone of Abrams

This test is conducted at the time of placing concrete in the formwork. In the event that by achieving it, the settlement is outside the limits, two concrete tests are conducted on two new samples taken from the same batch. If the results do not satisfy the conditions laid down, the concrete will be rejected. The persistent lack of compliance with the specified settlement will be sufficient to provide for the immediate cessation of concrete placement until the deficiency is corrected observed cause.

This test is conducted every time samples are molded to determine the strength of concrete, and at least every three (3) hours, or when visual observation indicated that the conditions are not met, for which the team be established by the standard should be permanently on work.

1.2 Tests to be performed to determine the characteristics of hardened concrete

a) Prior to the period of molding and execution of structures, also during the same , in addition to the tests described in determining the characteristics of fresh concrete , which are valid both for the case of concrete made on site and elaborated on central plant , the necessary tests are carried out to determine the resistance to compression fracture of the different types or classes of employees to execute concrete structures . The tests were performed at the age of 28 days, as specified under age or interest for advance information . In special cases the Project Manager may also decide to carry out further tests .

b) Fresh samples used for testing concrete, will be taken at the time and place of placing concrete in the formwork

All be molded specimens and tested in the presence of Authorized Representatives of the Project Management Contractor and approved laboratories and inspection .

c) Whenever samples Shall be made ,it is necessary to note down the type or class of concrete in question , the date and time of extraction , the identification number of the specimens molded with the sample , the required place of extraction referred to shall be recorded structure and the structural element in question , the concrete temperature at the time of extraction , and any other information needed to complete the identification of the concrete from the sample Which was Obtained . Entered All These data are on a register of cylinders Which must have the CONTRACTOR work continuously updated.

1.3. Resistance tests conducted to judge the uniformity and quality of concrete placed at Work

a) Shall mean a test result to the average of the resistances of the specimens molded with the same concrete sample and tested at the same age . In general, these specifications establish the average resistance of two specimens tested at the age of 28 days or younger specified in each case to judge the quality of the concrete.

b) All specimens were cured under standard conditions of humidity and temperature

c) Samples shall be taken at least 4 (four) per slab or part of the structure indicated by the Works Management .

It means shows the molding of two (2) cylindrical specimens , which must be extracted from the same batch simultaneously; ie the minimum number of samples to be taken by slab is 8 (eight).

CONTROL TEST:

Depending on their nature:

- Destructive: determine the strength by breaking concrete test pieces or parts.
- Nondestructive: determine the quality without destroying the structure.

2.1.8 CALCULATION OF QUANTITY OF WORKS AND PRICE

Table 3. *Budget of slab*

Ud.	Description	Yield	Unit price	cost(€)	
m2	Continuous system formwork reinforcement concrete slab Consist of : props, Metal girders and formwork surface treated wood Reinforced rods and profiles	1.100	14.78	16.26	
m	Expanded polystyrene molt to ledge	0.100	8.81	0.88

h	Structure assistant	0.527	16.94	8.93	
%	Auxiliaries	2.000	74.69	1.49	
%	Indirect costs	3.000	76.18	2.29	
				TOTAL X METERS	78.47
				TOTAL METERS	813.98
				TOTAL PRICE	63873.011

**Decennial maintenance cost: 3.92€ in the first 10 years.

TOTAL COST FOR SECOND FLOOR: 63.873,011 €

SURFACES CHEKING OF SECOND FLOOR:

- 1) Common área: 67,12 m²
 Rooms apartment: 61,1 m²
 Rooms apartment: 67,98 m²
 Rooms apartment: 51,67 m²
 Rooms apartment: 67,5 m²

TOTAL: 67,12 + 61,1 + 67,98 + 51,67 + 67,5 = 315,37 m²

- 2) Rooms apartment: 67,36 m²
 Rooms apartment: 51,60 m²
 Rooms apartment: 51,60 m²
 Rooms apartment: 71,34 m²

TOTAL : $67,36 + 51,60 + 51,60 + 71,34 = 242,9 \text{ m}^2$

- 3) Rooms apartment: $74,74 \text{ m}^2$
- Rooms apartment: $51,55 \text{ m}^2$
- Rooms apartment: $68,88 \text{ m}^2$
- Rooms apartment: $61,54 \text{ m}^2$

TOTAL: $74,74 + 51,55 + 68,88 + 61,54 = 256,71 \text{ m}^2$

TOTAL SECOND FLOOR: $315,37 + 242,9 + 256,71 = 813,98 \text{ m}^2$

2.1.9 TECHNICAL- ECONOMIC INDICATORS

1. Quantity of Works: 813.98 m^2
2. Instalation cost: 63873.011 €
3. Duration of Works: 7 days
4. Wage:

- Official 1st structure :

$8 \text{ h/d} \times 7 \text{ days} = 56 \text{ h.}$

$56 \text{ h} \times 18.10 \text{ €} = 1.013,6 \text{ €}$

- Structure assistant:

$56 \text{ h} \times 16.94 \text{ €} = 948.64 \text{ €}$

It has made the full financial calculation of the 2nd floor slab as it is " slab type " , but the buildings consist of 10 slabs in full:

- Slab 1-7: 813.98 m^2
- Slab 8: 806.78 m^2
- Slab 9: 644.72 m^2

So, it has to be calculated the totally of money:

- Slab 1-7: $813.98 \text{ m}^2 \times 78,47 \text{ €/ m}^2 = 63.873,011 \times 7 = 447.111,07 \text{ €}$
- Slab 8: $806.78 \text{ m}^2 \times 78,47 \text{ €/ m}^2 = 63.308,03 \text{ €}$
- Slab 9: $644.72 \text{ m}^2 \times 78,47 \text{ €/ m}^2 = 50.591,18 \text{ €}$

TOTAL: $447.111,07 + 63.308,03 + 50.591,18 = \mathbf{561.010,26 \text{ €}}$

2.2 TECHNOLOGICAL CARD II. INSTALLATION OF FOUNDATION PILES.

2.2.1 GENERAL DESCRIPTION

This deep foundation qualifies as easily implemented and warranty resistant behavior.

It is a reinforced concrete support a large length relative to its cross section, in this case, is constructed "in situ" in an open cavity in the ground.

. The concrete piles must possess certain characteristics, since it will not be vibrated:

- High resilience against segregation
- High plasticity and good cohesion
- Good flow and ability to self-compacting
- Sufficient workability during the pouring process, including withdrawal, if any, of interim cased.

Among the advantages of this system, we can state :

- There is no waste of material.
- The equipment is simpler, less bulky and easier to transport
- Allows widen the pile tip , so improve bearing capacity.

Drawbacks:

- Concrete can be mixed with water , sand or mud , may diminish its strength.
- During the commissioning phase of concrete , armature displacement may occur , so that the coating it could be insufficient.
- if not have passed the enough time to the piles harden, the implementation of new piles may be detrimental to the already executed.

BORED PILES WITH CONTINUOUS FLIGHT AUGER :

It is considered inside of system of drilling piles of rotation with spin helix. A helix in wich shaft there is a hollow tube, through which the concrete is poured while the propeller is being pulling out.

This procedure is often used in cases of unstable ground.

The helix is continuous and the hollow shaft is provided with a closure device to prevent entry of land or water during drilling.

The feed and speed of rotation of the auger is adjusted to terrain features to maintain the stability of the walls of the borehole.

In this case the armor of pile is put available once this has already been fully concreted, introducing it in fresh concrete. The depth of the reinforcement in the fresh concrete will be greater than 6 meters or 9 diameters.

The concrete used is a characteristic strength of 250 Kp / cm² (HA-25), placed by pumping , it has fluid or liquid consistency, so that the development of concrete superplasticizers have been incorporated.

The concrete, in the mouth of the propeller, reaches a higher pressure than the external, to completely fill the gap left by the extraction of drill.

The diameter of piles, in this case, are 80 cm and 60 cm and the depth is 8 m.

IMAGE 3 . *Continuous flight auger equipment*

Fig. 10 . Parts of continuous fligth auger

Drilling elements continuous auger :

5. Concrete

2.2.2 DESCRIPTION OF TECNOLOGY AND SEQUENCE OF WORKS

The basics components of foundation are:

- Concrete HA-25
- Iron armors B500S

CONSTRUCTION SEQUENCE:

1. PILE DRILLING

2. CONCRETING
AND
EXTRACTION OF
LAND AT THE
SAME TIME

3. CONCRETE
PILE

4. STEEL CAGE
PLACEMENT IN
FRESH
CONCRETE

IMAGE 4. *Sequence of Works of foundation*

SLAB LIKE PILE CAP:

To complete the solution of piloting, must run in the top of the pile , after removal of excess layer of concrete, the pile cap (beam head), that is going to be a monolithic slab of 23 cm, thus uniting all piles.

The pile cape makes that the piles work together. The reinforced are placed in the three directions (EHE-08) .

The reinforced of several piles are constituted, according to the EHE-08 , by:

Reinforcement type :

- Longitudinal Armor \varnothing 20 cm:
 - Principal of positive moments , on the lower face
 - Principal of negative moments , on the upper face (always appear when there is wall above)
 - Reinforcement of positive moments in underside (if necessary)
 - Reinforcement of negative moments in top face (if necessary)
 - Bars bent (if necessary)
- Transverse armor \varnothing 18 cm:
 - Transverse reinforcement of distribution perpendicular to the longitudinal reinforcement.

The slab will have a depth of 30 cm and 3 tie beams 30x40 cm and 6.13 m in length is going to be made.

IMAGE 5 . *Distribution charges from Wall to slab foundation and piles*

2.2.3 HUMAN SAFETY

The work will be carried out in accordance "with health and safety rules in construction request".

> Risks:

- Falls of personal at the same level
- Falls of people within the pile
- Stepping on objects
- Shock and incorrect operation of excavation equipment
- Cuts with sharp edges of the armor
- Overexertion in awkward positions
- Interference with underground pipes

> Preventive Measures:

- Work area marked and delimited.
- Maintain order and cleanliness in the work area.
- Removing the perforated ground.
- Maintain eye contact between the driver and assistant.
- Light and sound signaling of vehicles.
- No pass behind moving machines.
- Wear reflective clothing.
- Work platform have to be stable, horizontal, no subsidence and compact ground.
- The equipments will have their grounding and switches differential.
- The electric assembly and disassembly are made by authorized personnel and qualified.
- Maintain connections and cables properly.
- Perfectly drive the ground rod in the ground.
- Protect electrical cables in passageways of machinery.
- Reinforcement will have wooden block to avoid their moving.
- The elements of lifting loads must be reviewed periodically.
- Trespassing under suspended loads.
- No stockpiles less than two meters excavated areas.

> Signage

- Prohibition sign: prohibited certain conduct.
- Mandatory sign: forced certain behavior
- Warning sign: Warning of a certain behavior.
- Signs relating to firefighting equipment.
- Signs of rescue or relief.
- Light and acoustic signals.
- Risk of falling, shocks, bumps.
- Traffic routes.

- Storage areas for dangerous substances and preparations.
- Emergency situations.
- Dangerous maneuvers

➤ Collective protections

- Solid Surface security based planking .
- It is forbidden to store or collect materials up to 2 meters away. as a general rule .
- Avoid falling objects or tools at different levels within the gap.
- Security fence around work area with a height of 2 mts.

➤ Individual protections

- Approved safety helmet .
- Boots for rainy weather.
- Safety footwear .
- hearing Protection
- High Visibility Clothing
- gloves
- Safety glasses display
- Safety harness

2.2.4 MATERIAL- TECHNICAL RESOURCES

- Materials:
 - Concrete (Cement , water , steel, fine aggregate and coarse aggregate)
 - Armor steel .
 - To protect armor .
 - Pallets .
- Aids :
 - Ladder : for access to perform the assembly of the machine.
 - Vibrators or pinchos: are used to introduce the armor in the continuous auger.
 - Lifting elements : ropes , cables , chains , slings , hooks .
 - Hose connection of concreting.
- Equipment:
 - Excavators : prepares the work platform. Remove the lands and carries heavy objects.
 - Gondola : transports drilling equipment.
 - Group of oxyfuel and welding : welding and cutting equipment for iron.

- Crane : Loading and unloading material and raises the reinforcement and inserted into the pile.
- Concrete pump : pump the concrete to the top of the auger. It has a hopper where the concrete is pouring by the truck.
- Concrete mixer truck : transports concrete.

- Tools:

- Hammer
- Pliers
- Stakes
- Corrugated steel bars
- Chalk
- Rope to tighten

IMAGE 6 . Hose attachment for concreting

TOTAL DAYS: PILES 18 days																																				
FOUNDATION 32 days																																				

Therefore , the piles begin at once, but the piles in diameter 0.6 m, are finished 10 days before the diameter of 0.8 m .

Just after the complete execution of piles , you start to run the sewer and once completed, that time will be 7 days, begins the slab foundation, which duration is seven days and resources are 10, divided into 2 groups of 5 is made :

- 3 officers and 2 pawns (each group).

The three tie beams , which are the foundation slab were carried out while the slab , that ' s therefore are included in the time and cost of the slab.

2.2.5 QUALITY CONTROL

In addition to direct methods (visual inspection and geotechnical drilling), there are several indirect techniques for abnormalities in the foundation piles techniques.

Test sonic transparency in deep foundations (sonic survey, sonic test, cross-hole or crosshole). Detects and pinpoints abnormalities (faded, pollution, inclusion, ..., etc.). Is studied the ultrasound propagation between pairs of metal pipes embedded in the concrete putting inside in them probes.

Echo test (conventional hammer). Evaluates the length of the element by measuring the time between impact and its reflection time. Head is placed in an accelerometer and it is hit it with a conventional hammer. Requires hit on healthy concrete.

Testing of mechanical impedance in deep foundations (hammer with force sensor). In addition to length, by measuring the impact and vibratory response assesses the interaction with the terrain and section changes and / or quality of the material. Is placed on head a geophone and is hit with an instrumented hammer. Requires hit on healthy and smoothed concrete.

The piles are constructed according to the following ranges of tolerances:

- a) The eccentricity of the axis of the pile relative to the set position, should be less than 10 cm, for piles with a diameter up to one meter ($\emptyset \leq 1.0$ m) and tenth (1/10) of the diameter otherwise, but always less than 15 cm.
- b) For vertical slope inclination error piles should not exceed two percent of the value of the slope.

1. Soil behavior will be observed during drilling just checking that the conditions assumed are presented in the Geotechnical Report included in the Annual Report.
2. If obstacles during drilling are found, these will be removed by mechanical means. Explosives are not permitted within the bore. Is not allowed either the washing operation.

Concreting

1. The concreting of piles must be to keep in mind that it is done without generating air bags or water holes, cuts or bottlenecks.
2. The heads of concreting should be greater than 0.5 D, (where groundwater level 1.5 D), where D is the diameter of the pile.
3. If while demolition is observed that removal of the top was not enough to remove all deteriorated concrete and poorly done, the demolished concrete is replaced with new concrete, well adhered to the former. All these operations must be borne by the contractor.
4. The concrete is performed without interruption, so that if it happens to be performed with two successive masses and the first, it starts curing, the manager will decide if the work is valid or, if need be rejected The pile should be filled again.

5. The portion of filling after the rejected pile can run with lean concrete, but implementation will be done with the same care as if it were a pile undergoing charges.

Tolerances

It is impossible to place the piles at the point or the exact angle you have indicated in the project, because they tend to depart or deviate when they find hard or soft spots in the field. The plans and specifications must tolerate a displacement of 5 cm at the top of the small piles driven into the ground and 15 cm (and sometimes more) in driven piles through the water. A collapse or angularity on the axis of the pile 1 or 2 percent, relative to the length of the pile , no generally affects their capacity and , therefore , should be permitted in the project and specification . Commonly larger tolerances are allowed, if load tests show that the piles can withstand the loads safely.

1. The position of the piles in the ground , after being built , must not differ more than 10 cm . That is, the error is not greater than 2% of the length of the pile .
Should make cleaning treatments and background .
2. The excavation will proceed to the extraction of cuttings that have been stored in the bottom of the cavity. In large diameter piles , down from an operator is performed to measure such cleaning.

2.2.8.4 Concrete for beams

1. Quantity of works:

$$0,3 \times 0,4 = 0,12 \text{ m}^2$$

$$0,12 \times 6,13 \text{ m} = 0,736 \text{ m}^3$$

$$0,736 \text{ m}^3 \times 3 \text{ beams} = 2,208 \text{ m}^3$$

2. Installation cost:

$$2,208 \text{ m}^3 \times 151,44 = 334,379 \text{ €}$$

3. Works duration: 30 mins.

4. Wage:

- Steel worker:

$$0,5 \text{ h} \times 1,10 = 0,55 \text{ €}$$

- Steel helper:

$$0,5 \text{ h} \times 1,03 = 0,515 \text{ €}$$

2.3. TECHNOLOGICAL CARD III. INSTALLATION OF ROOF COVERING

2.3.1 GENERAL DESCRIPTION

The roof consists of the following layers:

- Monolithic reinforced concrete slab
- Layer primer
- PE steam insulation (vapor barrier) .
- Layer slope formation of clay (dry sand)
- Regularization layer
- 25 cm of polystyrene
- PE modified waterproof .
- Geotextile
- Gravel

Fig 12 . *Layers of roof*

1. Slab
2. Vapor barrier
3. Layer slope formation
4. Regularitization layer
5. Insulation layer of polystyrene (25 cm)
6. Waterproof layer
7. Geotextile
8. Layer protection (gravel)

Thermal insulation materials must be protected from rain, snow, ice and mechanical damage during construction.
The insulation must be installed so that the layers can withstand strong compression with each other and the adjacent load of the structure.

Where the insulation is attached to the concrete structures need to work with extreme caution.
The insulation must touch the ground along the entire surface and should be positioned so that it will not move during concreting.
In the case of multiple layers as insulation, they overlay one another.
Layers and pipes and ventilation must be installed in accordance with the project.

The execution must be reviewed and approved before each of the following phases.

During the installation of insulation coatings must be protected from mechanical damage , water , snow , ice and additional charges that may be damaged .No can be wavy or jagged .

Roll coating the ceiling must be installed in accordance with design drawings according to roofing, etc. materials used in the requirements and / or manufacturer's recommendations. The structure must be strong and smooth. Insulating layers can not be damaged.

Gradients:

Ceiling gradients must comply with the drawings. The slope of rainwater is 3.5%.

The roof must be built properly so that no water accumulates on it .

Mechanical strength :

The coating should resist wind suction , at least as shown in the construction specifications .

In order to ensure adequate resistance to wind uplift be suitable for fixing on the roof of the overlays .

Steam insulation :

Steam insulation film modified PE 0.2 mm must be installed on a concrete slab .

Vapor barrier must be installed along the entire roof edge sealed .

Thermal insulation:

The thermal insulation must be resistant to decay from non-combustible inorganic materials impervious to moisture.

Thermal insulation materials must be protected from rain, snow, frost and

mechanical damage during construction.

The insulation must be installed so that the layers of heavy compression with each other and adjacent structures.

Places where insulation is fixed to the concrete structures need to work with extreme caution.

The insulation must touch the ground along the entire surface must have sufficient strength and compression load with acceptable deformations.

Even the insulation must be protected from moisture and heat during the day by isolation, why they should be covered and sealed with a single layer of waterproofing.

Stormwater drainage:

Drainage system of rainwater to ensure the supply of water to the maximum intensity of the rain.

The diameter of the pipes must be at least 110 mm.

On the facade it must be equipped with emergency rainwater to the conclusion that there is flooding due to high rainfall intensity or sewage system failure.

All tubes and lines that cross the ceiling should be well sealed and waterproof or moisture.

The area of total roof is 644.72 m²

2.3.2 DESCRIPTION OF TECHNOLOGY AND SEQUENCE OF WORKS.

1. Primer coat the entire surface.
2. Stakeout hip roof and valleys roof.
3. Placing insulation layer (PE) on all sides and over the entire surface of the slab and fixing air duct.
4. Placement manufactures edge (protruding structure) and sealed.
5. Execution of valleys roof and hip roof.
6. Implementation of slope formation.
7. Layer regularization.
8. Geotextile
9. Polystyrene
10. PE modified, layer waterproofing.
11. Placement PE.
12. Geotextile.
13. Gravel.

Image 7 and 8 . *Placement of insulation layer and gravel.*

2.3.3 HUMAN SAFETY

It can be found different risks:

- Bumping into objects
- People fall at same level
- Peoples fall different level
- Hurts by handling objects and hand tools
- Particles in the eyes
- Dermatitis (contact with cement)
- Objects falling on persons
- Moves of charges
- Electrocution
- Direct contact with lines of high tension
- Inadequate illumination
- Footsteps on sharp objects
- Sudden collapse
- Overexertion

➤ Preventive Measures

- Load distributing materials collection
- All workers should have full knowledge of health and safety standards to perform the work.
- If missing natural lighting, work areas must be provided for artificial light, which worked less than 24 V and protected by insulated handle. The minimum illumination of 100 lux will be placed 2 meters from the ground.
- Order and cleanliness in the work area. Stockpile areas concerned.
- To avoid overexertion, workers must go changing position.
- Workers must wear a safety harness attached to a safety point.
- Workers must be used properly working equipment, tools and materials, which will be provided with the rules of correct use.
- Each employee must use the appropriate personal protective equipment.

➤ Collective protections

- Safety nets.
- Resistant railing at least 90 cm , will handrails, intermediate and baseboard.
- The horizontal rails and vertical networks , to protect the holes.
- Safety harness all workers , lifeline.

➤ Individual protections

- Safety helmet with ventilation holes.
- Anti -slip footwear.
- Glasses anti - particles.
- Red adjusted and non-flammable.
- Belts.
- Arnes anti- falls for work at height.

Fig 13. *Protections for workers at height (roof)*

2.3.4 MATERIAL- TECHNICAL RESOURCES

- Materials:
 - Clay (to make gradient).
 - Polystyrene
 - Roller material
 - Mixture of propane-butane
 - Polyester
 - Cement mortar
 - Bitumen primer
 - Tin coating curved profiles

- Equipment:
 - Crane
 - Sealing equipment special additional burner
 - Multiple gas burner

- Tools:
 - Roller
 - Wheelbarrow
 - Brush
 - Rubber brush
 - Roulette
 - Marker
 - Hammer

Table 10 . *Material technical resources of roof*

Thermal insulation polystyrene 25 cm		2								2							
Steam insulation waterproof						5								5			

Due to the high percentage of rain in Vilnius (Lithuania) , the vapor barrier should be placed immediately after placing the thermal insulation, so the day was divided into hours , and in the same aunt, the layer of thermal insulation (polystyrene 25 cm) , and immediately after placement of the vapor barrier will take place . The duration will be :

- Four for thermal insulation (per day) .
 - Four hours a vapor barrier (per day) .
- So, the eight hours of work a day are achieved.

2.3.6 QUALITY CONTROL

According to Decree 59/1994 of May 13, which regulates the quality control of the building and its use and maintenance, to define:

- Criteria for receipt of materials to be controlled.
- Lots, test samples and corresponding tests and documentación (certificates, seals, etc.) that suppliers must provide.
- The criteria for acceptance or rejection of lots.

If the technical direction of the work decides it is necessary to increase the minimum tests or tests described in Quality Control Program, these trials / tests were conducted on other components involved in the work to be done.

The materials being objective of control, shall comply:

- Criteria reception
- Criteria for acceptance or rejection
- Documentation for the end of the work
- Reception control (documentary control)
- Control execution

The cover must meet the test of sealing service.

- Range of application: all flat roofs be objective of control, regardless of the material used as waterproofing.
- Definition of the event: the leak test will be held by flooding for 24 hours at least; or for 48 hours, continuous watering. (Article 5.2. Basic Building Standard NBE Q-90).
- Criteria for acceptance or rejection, if moisture appear during watering or 48 hours, the cover will be rejected. Otherwise, it be accepted.

* Document establishing certification of the materials used, according to NBE Q-90, on roofs with bituminous materials.

Economic evaluation of the program.

- Testing of Concrete
- Testing of steel
- Test sealing covered

It is necessary to control both the execution process and the material used for the execution of the cover.

It begins with the control of the slab as it support the entire top structure. Since this is a concrete structure must meet the strength required in the project.

The cover, in addition to serving to hedge against the erosion, is a structural element, which in addition to supporting its own weight, supports loads of external agents (snow, rain, wind), so you have to check the features specific materials that form it .

In the technical acceptance of materials to work should be checked quality marks, tests and requested by the standards. They must have the CE mark.

You will need to machinery and tools are prepared before starting the work.

The first thing to make is the replanned of the gradients with respective evacuation systems, previously replanned (phase structure), then we find the corresponding hip roof and valley roof, then the vapor barrier is placed, which must be totally watertight that no water, special care should be taken in areas of critical points and edges and meetings with parapets or input and output areas (doors) for the formation of slopes used, in this case, dry sand, waterproofing sheet, with its own reinforcement at critical points, rock wool, which is placed panels along the whole cover, polystyrene placement carefully so that it reaches all points of the entire roof, geotextile separator and finally, gravel.

	Decennial maintenance cost : € 16.26 In 10 Years		TOTAL	65.02

Flat roof not passable , not ventilated , with gravel, conventional type, slope of 1 % to 5 % , consisting of: forming slopes : expanded clay 350 kg / m³

density , poured into dry and consolidated its surface with grout cement, with the average thickness of 10 cm;waterproofing monolayer attached : sheet of elastomer SBS modified bitumen , LBM (SBS) -40 -FP , fully adhered torch ; spacer layer under protection geotextile nonwoven comprising polyester fibers together by needling , with a longitudinal tensile strength of 2 kN / m , a resistance to transverse tensile strength of 2 kN / m , a puncture strength 0.4 kN CBR and a surface mass of 200 g / m² ; protective layer : 10cm boulder 16-32 mm in diameter.

2.3.9 TECHNICAL- ECONOMIC INDICATORS

1.Quantity of works:

644.72 m²

2. Installation cost:

644.72 m² x 65.02 € = 41.919,69 €

3. Works duration: 15 days

4. Wage:

8 hours / day x 15 days = 120 h.

Official 1st construction: 120 h x 8,36 = 1.003,2 €

Construction ordinary laborer: 120 h x 10,94 = 1.312,8 €

Official 1st applicator waterproofing sheets:

2 days x 8 h/d = 16 h.

16 h x 2.09 = 33,44 €

Assistant applicator waterproofing sheets:

16 h x 1.95 = 31.2 €

Official 1st insulation fitter :

4 d x 8 h/d = 32 h.

32 h x 0.89 = 28.48 €

Insulation fitter helper:

32 h x 0.81 = 25.92 €

3. ORGANIZATION PART

3.1 ANALYSIS OF CONSTRUCTION MASTER PLAN

3.1.1 DESCRIPTION OF THE TERRITORY

The plan of building lots composing for a construction of multi-dwelling building in Vilnius (Lithuania), Konarskio Street 12.

The preparation of territory is done before the start of the works. Once obtained the proper permission for the occupation of public area, temporary booths are placed on the sidewalk. All the work area and the area where temporary workers are buildings will be fenced and marked to not be dangerous for pedestrians or cars. The road remains unchanged, since the occupation of the same is not necessary. In the plan of the construction site should contain:

- Construction of the main working machine.
- Material storage areas and waste.
- Temporary Electricity.
- Sanitary drinking water and sewerage.
- Fire Hydrant.
- Safety and hazardous areas.
- Vias temporary access and passageways.
- Temporary buildings.

Previous performances:

- Cleaning work area
- Installation and signaling fenced work area.
- Prepare material storage areas.
- Temporary buildings for workers will be supplied by water and electricity. for temporary connections to the existing network.
- Prepare and out of vehicles and staff to work.
- Fence: The work will be protected by welded mesh 2 meters high and 1.5 meters wide, with concrete support. The fence is separated from the facade of a minimum of three meters, according to the Spanish legislation for pedestrians are aware of it, on the fence mesh sewn concealment.
- Access to work is independent, there will be two access for heavy vehicles of 4.5 meters and two pedestrian access 1.5 meters.

Signals:

The work has the corresponding signals, signs, fencing and security lights to indicate in advance all potential hazards.

Based on the fundamentals of the Spanish code signals:

1. The sign should be easy to perceive, visible, striking.
2. It should be understood perfectly, with clear messages as: DANGER, WARNING, HIGH.
3. Visibility:

- Daily Signs: harnessing sunlight showing: triangles, fences, red bands, etc.
- Night Signs: artificial light
- Electricity: available onslaught of electricity at low voltage, so it is not necessary transformer.
- Water supply: connection to the mains supply.
- Wastewater: connection to the General Sewerage System through PVC pipe.

3.1.2 SELECTION OF THE CRANE

This part explains why we chose our LIEBBHERR 130 EC-B6 tower crane.

Tower crane being selected in two ways:

- According to the technical parameters.
- According to economic parameters.

The location of the crane and its motion must be such that the capacity of the crane can lift the most distant elements.

Tower crane selection:

1. Length of arm
2. Lifting capacity
3. Lift height hook

We chose this crane according to technical parameters.

To perform the calculations, we have to know in advance the following parameters:

1. The size and location of the building (underground parts and excess land).
2. The weights, dimensions and location of the facility construction.
3. Working conditions (the peculiarities of the construction, soil characteristics and peculiarities of the underground structures).

First, we must determine whether they conform to the technical characteristics of the crane inequalities:

$$Q_k > Q_R.$$

$$H_k > H_R.$$

$$L_k > L_r$$

Here:

Q_k - the power of the ascension of the selected crane, t

Q_R - ascension power required t

L_k - reach the selected crane boom, m

L_R - the extent required crane boom, m

H_k - lifting height of the selected crane hook, m

H_R - the necessary lifting height of hook, m

The crane technological parameters are calculated according to the construction characteristics.

Is required is the selection according to the tables of technical characteristics of the cranes.

First of all, we must check if crane technical characteristics match the inequalities:

$$H_r = \text{building height} + 3\text{m} = 31.50 + 3 = 34.50 \text{ m.}$$

The power of the ascension of the crane:

$$Q_r = P + P_{STR} = 2.5 + 0.15 = 2.65 \text{ t.}$$

- P weight-lifting heavy construction, concrete.
- Pstr- lifting equipment, t.

The reach of the boom of the crane L_r is calculated according to our needs. The location of the crane is inside the plot, but outside the building, so do not bother during the execution of the work and from there covers a radius where it reaches the perimeter.

According to Spanish legislation:

Vehicles must be able to circulate around the work area, so they have to be free to allow the circulation of machinery, a minimum of 4.5 m steps.

- Distance between the tower crane and front line: 4.89 m.
- Distance to fenced area of material to tower crane: 7.37 m.

When the values of L_r , H_r and Q_r are calculated, the crane could be selected. As for determining the scope of the pen L_r crane it will be necessary to know the low crane stands and dimensions shift platform. These values are found in the diagrams of the crane.

$$L_r = 46.52 \text{ m}$$

When the values of L_r , H_r and Q_r , are calculated, the crane could be selected using the diagrams of the tower crane.

The diagrams show that the crane can be used is LIEBBHERR 130 EC- B6.

$$Q_k > Q_r \quad 3 \text{ t} > 2.65 \text{ t}$$

$$H_k > H_r \quad 40 \text{ m} > 34.50 \text{ m}$$

$$L_k > L_r \quad 50 \text{ m} > 46.52 \text{ m}$$

As we can see , we have selected the crane is able to perform the necessary work.

DIN/FEM

Turmdrehkran 130 EC- B6

3.1.3 SETTING OF DANGEROUS ZONE

During installation works in parts of the construction , bars , workplaces and crossings dangerous areas are emerging. During construction such areas are called hazardous areas. At the beginning of the construction works during construction and hazardous areas , in which constantly arise or may arise risk factors they should be determined. Hazardous areas are divided into two groups:

1. Dangerous areas where hazardous and / or dangerous factors constantly affect processes.
2. Hazardous Areas in which dangerous factors may appear.

Constantly operating factors area is:

1. uninsulated parts of electrical equipment
 2. machines or parts of places of transit
 3. The areas in which a loading crane
 4. unenclosed areas where there is a greater difference and 1.3m high.
- Increasing the danger zones of the loading crane depends on the size of the load and lift height.

Table 12. *Limiting the dangerous zones from non-insulated zones from the fenceless un-insulated parts of the electrical equipment.*

Voltage, kW	Distances, limiting the dangerous zones from the fenceless un-insulated parts of the electrical equipment or from the vertical plane, which is the nearest power line wire, with a projection on the land, m
<1	1.5
1-20	2.0
35-110	4.0
150-220	5.0
330	6.0
500-750	9.0
800(current)	9.0

The limits of dangerous zones where the risk factors of harmful substances exceeding appears should be determined by measurement.

Dangerous zones in which dangerous factors could appear are:

- Near buildings under construction and assembling/dismantling buildings structures or equipment.
- Places over which the structures or equipment installation/dismantling works are executing.
- Places over which loads are lifting and transported by cranes.
- Places where the machinery, their parts or work equipment are moving.

Determination of crane dangerous zones

The limits of dangerous zones where there is a transfer of elements performed by crane are determined by calculations, the sum of horizontal projection of lifted element, the maximum length of biggest elements and its possible fall distance.

Due to the conditions surrounding our lot we have to consider our danger zone should not override existing buildings. Then, let put some limitations on the movement of loads with the crane:

- Raise the load vertically to a reasonable height, and then carry the load to the centre turning radius to reduce the area of danger zone.
- The projection of the arm of crane will not be performed on existing buildings.

The next risk will be considered:

- Presence of obstacles.
- Areas of way.
- Jobs in proximity to high voltage power lines.

The prevention measures are established on the basis of the following legal text, following the spanish rules:

-Royal Decree 836/2003 of 27 June, approving a new Technical Instruction "MIEAEM2" Regulations Lifting and handling equipment, referring to tower cranes for construction or other applications.

-Royal Decree 1215/1997 of 18 July, laying down minimum safety and health for use by workers in teams.

Presence of obstacles

In paragraph 7.3 of the UNE 58-101-92, states: "The vertical clearance between the pen and the last area of movement of personnel shall be minimum 3 meters. If the load or empty hook passes within 3 meters of the area, will be necessary placed on it enough to prevent the indicators of his approach."

This means that when the crane weathervane turn must respect the distances. And the area, which inevitably we must consider the burden.

We are not inclined to use signaling and also taking into account the flexibility of these structures, walkways in paragraph 4.1 of the UNE 58-101-92 states: "The minimum clearance for the passage of personnel, among the most prominent parts of the crane and any obstacle is 0.60 meters wide and 2.50 meters high. In case of failure application of this condition will prohibit the access of staff to this area dangerous". We have considered a minimum distance between the tip of the arrow and the nearest obstacle of 2 meters.

Fig. 17 Example of *diagram of tower crane safety distances*.

IMAGE 7. *Buildings nearby. Image taken from the information about building given.*

3.1.4 TEMPORARY ACCESS TO THE WORK SITE

To that vehicles can access the area of work will find two roads to the side of the building, one on each side , as there is a door to driveway and one output . The road is 7.04 meters.

No material or equipment along the main street Konarskio is received.

The width of the street is suitable to permit the passage for the trucks, the necessary trucks during construction works.

Temporary roads are built to bring construction materials.

The wide of the road has to be at least 6 meters, and the smallest distance from the road to the storage place is 1 meter. These roads are built to ensure easy driving to the building place and fast work.

3.1.5 TEMPORARY STORAGE AREAS

Storage areas are located within the plot, between the fence and the building. Located very close to the crane, which is easier to load materials and close the inlet and outlet of the equipment , so it is more sencilla loading and unloading. Besides not prevent the passage of workers during the transcuros of work . All materials must be within that area, and should be kept clean and tidy.

3.1.6 TEMPPORARY BUILDINGS FOR WORKERS AND MANAGING STAFF

As directed by the spanish rules: RD 1627/97 and RD 486/1997 (although not mandatory, we will take as a reference for the dimensioning of these areas), we can dimension and condition these areas as follows:

Toilets and changing rooms

Depending on the maximum number of operators that can be found in the execution phase of the work surface and necessary elements for these facilities shall be determined:

- 1 Shower (1 pc / 10 workers)
- 1 Toilet (1 pc / 10 workers)
- Sink Basin (1 pc / 10 workers)
- 1 Mirror (1 pc / 10 workers)

These elements are complemented by the auxiliaries needed: Towel, soap, etc.

The changing rooms will be equipped with seats and individual lockers with key, for clothing and footwear.

The area designated for changing rooms will be 2 m² per operator.

The máximum number f workers will have to work at the same time be 33, so $33 \times 2 = 66 \text{ m}^2$

The enclosure cleaning service have hot and cold water in showers and sinks.

Dining room

The campus dining service will be adapted to the number of operators and shall be provided with dimensions table, chairs, tableware, hotplates and sink with hot and cold water.

Office

They have an office work that lets you store and archive documents relating to the work (Security Plan, logbook, etc) being, in turn, such documentation available to the personnel involved in it.

Work in the office of a first-aid kit with the minimum content indicated by law, and multipurpose dry powder extinguisher of effectiveness will be installed 13 A.

3.1.7 TEMPORARY ELECTRICITY SUPPLY

The provisional electrical installation work shall conform to the specifications set out in the ITC-BT-33, because it is a temporary facility, considered work for the duration of related work.

However, in local construction services (offices, dressing rooms, sanitary facilities, etc.) the technical requirements contained in the ITC-BT-24 shall apply.

Connection operations are included from the general thrust of the work to the provisional installation of electricity, from which outlets will be drawn in sufficient numbers to connect electrical equipment and lighting points needed to ensure lighting work.

The interim facility will consist with the overall scorecard and protection, which will supply circuits to the side frames.

The outputs of the secondary panels are protected with differential and circuit breakers.

It should provide points of outlets in sufficient numbers, and located at a reasonable distance from the area to build and tasks.

Lighting should reach all the roads of the work and areas with no natural light.

Electrical switchboards, will be located in areas easily accessible and will be closed with safety locks

Both for installation and for the withdrawal, it is necessary to be performed in the absence of power line and when that line is no longer needed, it should retract the hose and ring the switchboard.

3.1.8 TEMPORARY WATER SUPPLY

The water supply from making a deposit or driving to Vilnius rush .

The installation will consist of : offtake , supply line and distribution network.

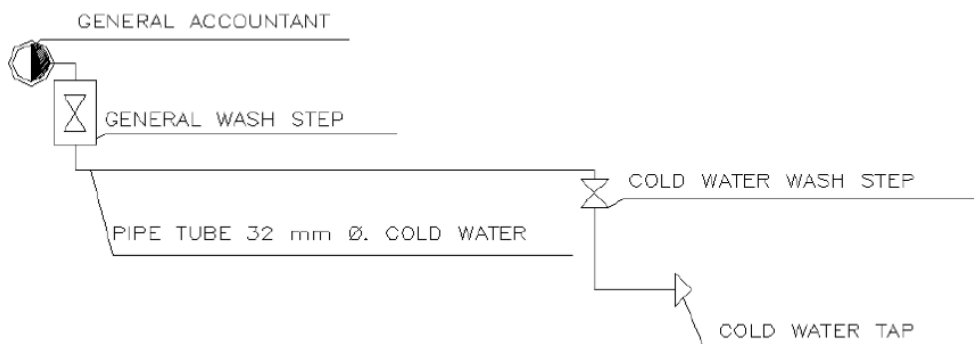

Installation will be available hot water in showers and sinks.

Have a sufficient supply of drinking water in proportion to the number of workers, all of them easily accessible and distributed in close to the jobs places.

It will be indicated by signs whether the water is not drinkable .

A sink with running water , soap provided for each 10 employees or fraction thereof will be installed.

Toilets and urinals are installed and kept in proper conditions of disinfection and deodorization.

3.1.9 TEMPORARY SEWERAGE

Sewer pipes will be PVC and will have a diameter of 200 mm, go for surface and will be connected to a nearby well to work.

The removal of the sewer connection PVC serving booths and placed superficially because runs along the side of the site, is protected in areas of crossings with concrete.

The survey was done manually and load the container.

The sewer construction will consist on removing water from rain and the elimination of waste water as a shower, basins and toilets.

3.1.10 CONSTRUCTION SITE LIGHTINING

To calculate the number of luminaries necessary for the correct work illumination we use the following formula:

$$N = \frac{E \times A}{\phi_n \times F_{ux} \times F_m}$$

Where:

N: Luminaries number are required

E: Average luminance in lux

A: Local area m²

ϕ_n : Flow lamp rate in lumens

F_u: Factor of use

F_m: Maintenance factor

The surface of the work area is 4.470 m², to be illuminated with an average illumination of 15 lux, with 1x150 W metal halide lamps, which produce a luminous flux of 13000 lumens per lamp. Will be used a normal maintenance factor 0.95.

Data from the lighting area are:

Length: 95.22 m

Width: 35.18 m

Height: 4.50 m

$$\text{Index } K = \frac{l \times b}{h(l+b)} = \frac{4470}{4.50(95.22+35.18)} = 7.61$$

With this index, and media with floor colors and ceiling, and clearing to the walls, is a factor in initial use in direct lighting luminarie 1.

$$N = \frac{E \times A}{\phi_n \times F_{Ux} \times F_M} = \frac{15 \times 4470}{13000 \times 1 \times 0.95} \approx 6$$

By calculation we have obtained that we need a minimum of 6 lamps.

3.1.11 FENCE OF CONSTRUCTION FIELD

The construction fence will protect the perimeter of the plot. The maximum width of the strip of public or private space to be occupied by work fence is 2 meters. The minimum step width should cover separation or boundary between pedestrians and traffic.

Working procedure:

1. The perimeter fence of the plot according to plans and before the start of the works will be performed. The fence should be used to be a dull and corrugated with fixed anchors on the firm ground, esta solo is replaced by another model, not opaque and removable metal stands counterbalanced always twisting metal fence.

Characteristics the Fence:

- You will have 2 meters.
- Gate para Vehicle access 4.5 meters wide and independent access door para personnel access.
- The minimum distance between the fence and 2 meters will be excavation.

2. Shall furnish as minimum signaling:

- No parking in the driveway.
- Mandatory helmet use in the area of the site.
- Prohibition of entry to any person outside the work.
- Poster work.
- Making space for the description of the location of the general connection cabinet, in which we can deduce into account the Low Voltage Electrotechnical Regulations.

He placed the light box work as close to the entrance, still on a sufficiently stable support along the same extinguisher (CO₂ 10 Kg.) Placement of a A separate ground connects with its corresponding basin copper and base of the box esta always placed a wooden base to prevent possible indirect contacts (EXAMPLE: for a pallet).

There is no mistaking the safety fence or enclosure of the work, signaling and fencing as this, it is to inform and signaling a particular area that may present potential risk para UN workers traversing Nearby Places .

When there is a risk of falling from a different level have handrails and yes, you should bring a way to close the passage without leaving gaps and Gap Minimum distance of 1.50 m.

EI Royal Decree 1627/97 establishes with regard, as obligation of the coordinator for safety and health during the execution of the work, to take the necessary measures to ensure that only authorized people can access

this her. The Project Manager will assume esta Function When no designation was necessary coordinator.

3.1.12 GENERAL REQUIREMENTS OF LABOR SAFETY

Here we will evaluate the general hazards and choose the individual protective measures which must be available for workers protection.

List of hazardous jobs:

- Excavation works
- Working crane
- Reinforcement and concrete works
- Formworks installation
- Welding
- Height work
- Roof and facade installation
- Installation works
- Work with hand tools and power machinery

Image 8. *Order of Works area*

Individual protective elements:

- The safety helmet is expected per worker every six month.
- The safety helmet with viewfinder, just one every ten workers is expected, because their use is more specific than normal helmets.
- Helmet with ear protectors: Is provided to one every five workers.
- Safety glasses: Are expected every three workers.
- Hearing protection (foam earplugs): Some ones per worker every two month for works around loud noises.
- Fine dust filter mask: One per worker every two month.
- Gloves: Some gloves per worker every six month.
High resistance to cutting and abrasion gloves: One every five workers every six month.
- Welder gloves: A pairs of gloves for welder every ten workers every nine month.
- Dielectric gloves: Two pairs, their use is limited for electrical work.
- PVC Boots: A pair of boots every five workers every nine months for work duration.
- PVC water boots: A pair of shoes per worker every nine months of work duration.
- Dielectric boots: Two pairs for all the work, their use is limited for electrical works.
- Seat belt lifeline: One every ten workers and twelve months of work, for working at height together with safety lines.
- Safety belt: One every three workers and six months.
- Device fall arrest safety belt: One every three workers and six months.
- Fall arrest system: One every three workers and six months.
- Strip back injury protection: One worker for nine months of working duration.
- Coverall: One per worker every six months.

Collective protective elements:

- Safety net: under first structural floor, only where there are more than 1 floor.
- Safety harness: One per worker.
- Perimeter railings: One on each working floor.
- Walkways and ramps at the same or different level.
- Working platforms: for height works.

Image 9. *Horizontal red to protect the holes.*

3.1.13 ENVIRONMENTAL PROTECTION REQUIREMENTS

It must have planned the management of wastes generated during the works.

There must be a previous study for wastes, classified according to their nature and dangerousness, and it will be checked which can be recycled and which cannot.

With this plan of construction wastes, when construction works are finished, wastes must not stay in our field.

During works execution we will have different containers for separate wastes. We must appoint one person who will control the management of wastes.

3.1.14 FIRE PROTECTION REQUIREMENTS

Before the construction we must consider the fire risk and the damage that this may cause. We will do a risk study and establish fire safety measures and means of protection and fire suppression.

During the construction works, rules about fire protection will be followed—construction works and installation of fire protection rules.

In the construction site will have a visible and accessible place where there should be a panel with inventory:

- Two buckets
- Two axes
- Two crowbars
- Ladders
- Hook
- 0.5m³ of sand box
- Two fire extinguishers
- Two spades

ARCHITECTURAL PART

The final thesis consist of the constructive description of the residential and commercial building in Vilnius (Lithuania).
 - The building is located at 12 St. Konarskio.
 - Projected 9 floors (ground floor + 7 floors + attic floor)
 - Apartment blocks consists of three sections. Two of them are in the 0.00 level, but one of them start at level -0.36 m, due the slope (it can see in drawings).
 - One part of first floor, is dedicated to commercial space.
 - The floors between the second and ninth floor are adapted for residential use.
 - Each block has four apartments on each floor, so the building has 90 apartments.
 - No basement, therefore, in the inside of the plot has been built parking spaces, very close to the building. There are 90 residential parking spaces and 10 to the commercial area.
 - Everthing done in the building, is adapted according to the spanish rules.

- ACCESS TO THE PLOT
- ACCESS TO THE BUILDING
- ROAD SIGNS

5 cm enhanced fine-grained (gravel)
 - PE modified, Steam insulation (waterproof)
 - 5 cm hard rockwool
 - 20 cm rockwool
 - 1,00-20,0 cm slope forming layer (dry sand)
 - 0,02 cm vapor barrier of PE modified film
 - 23,0 cm monolithic slab and fill surface is painted.

Stainless steel handrails attached to the parapet.

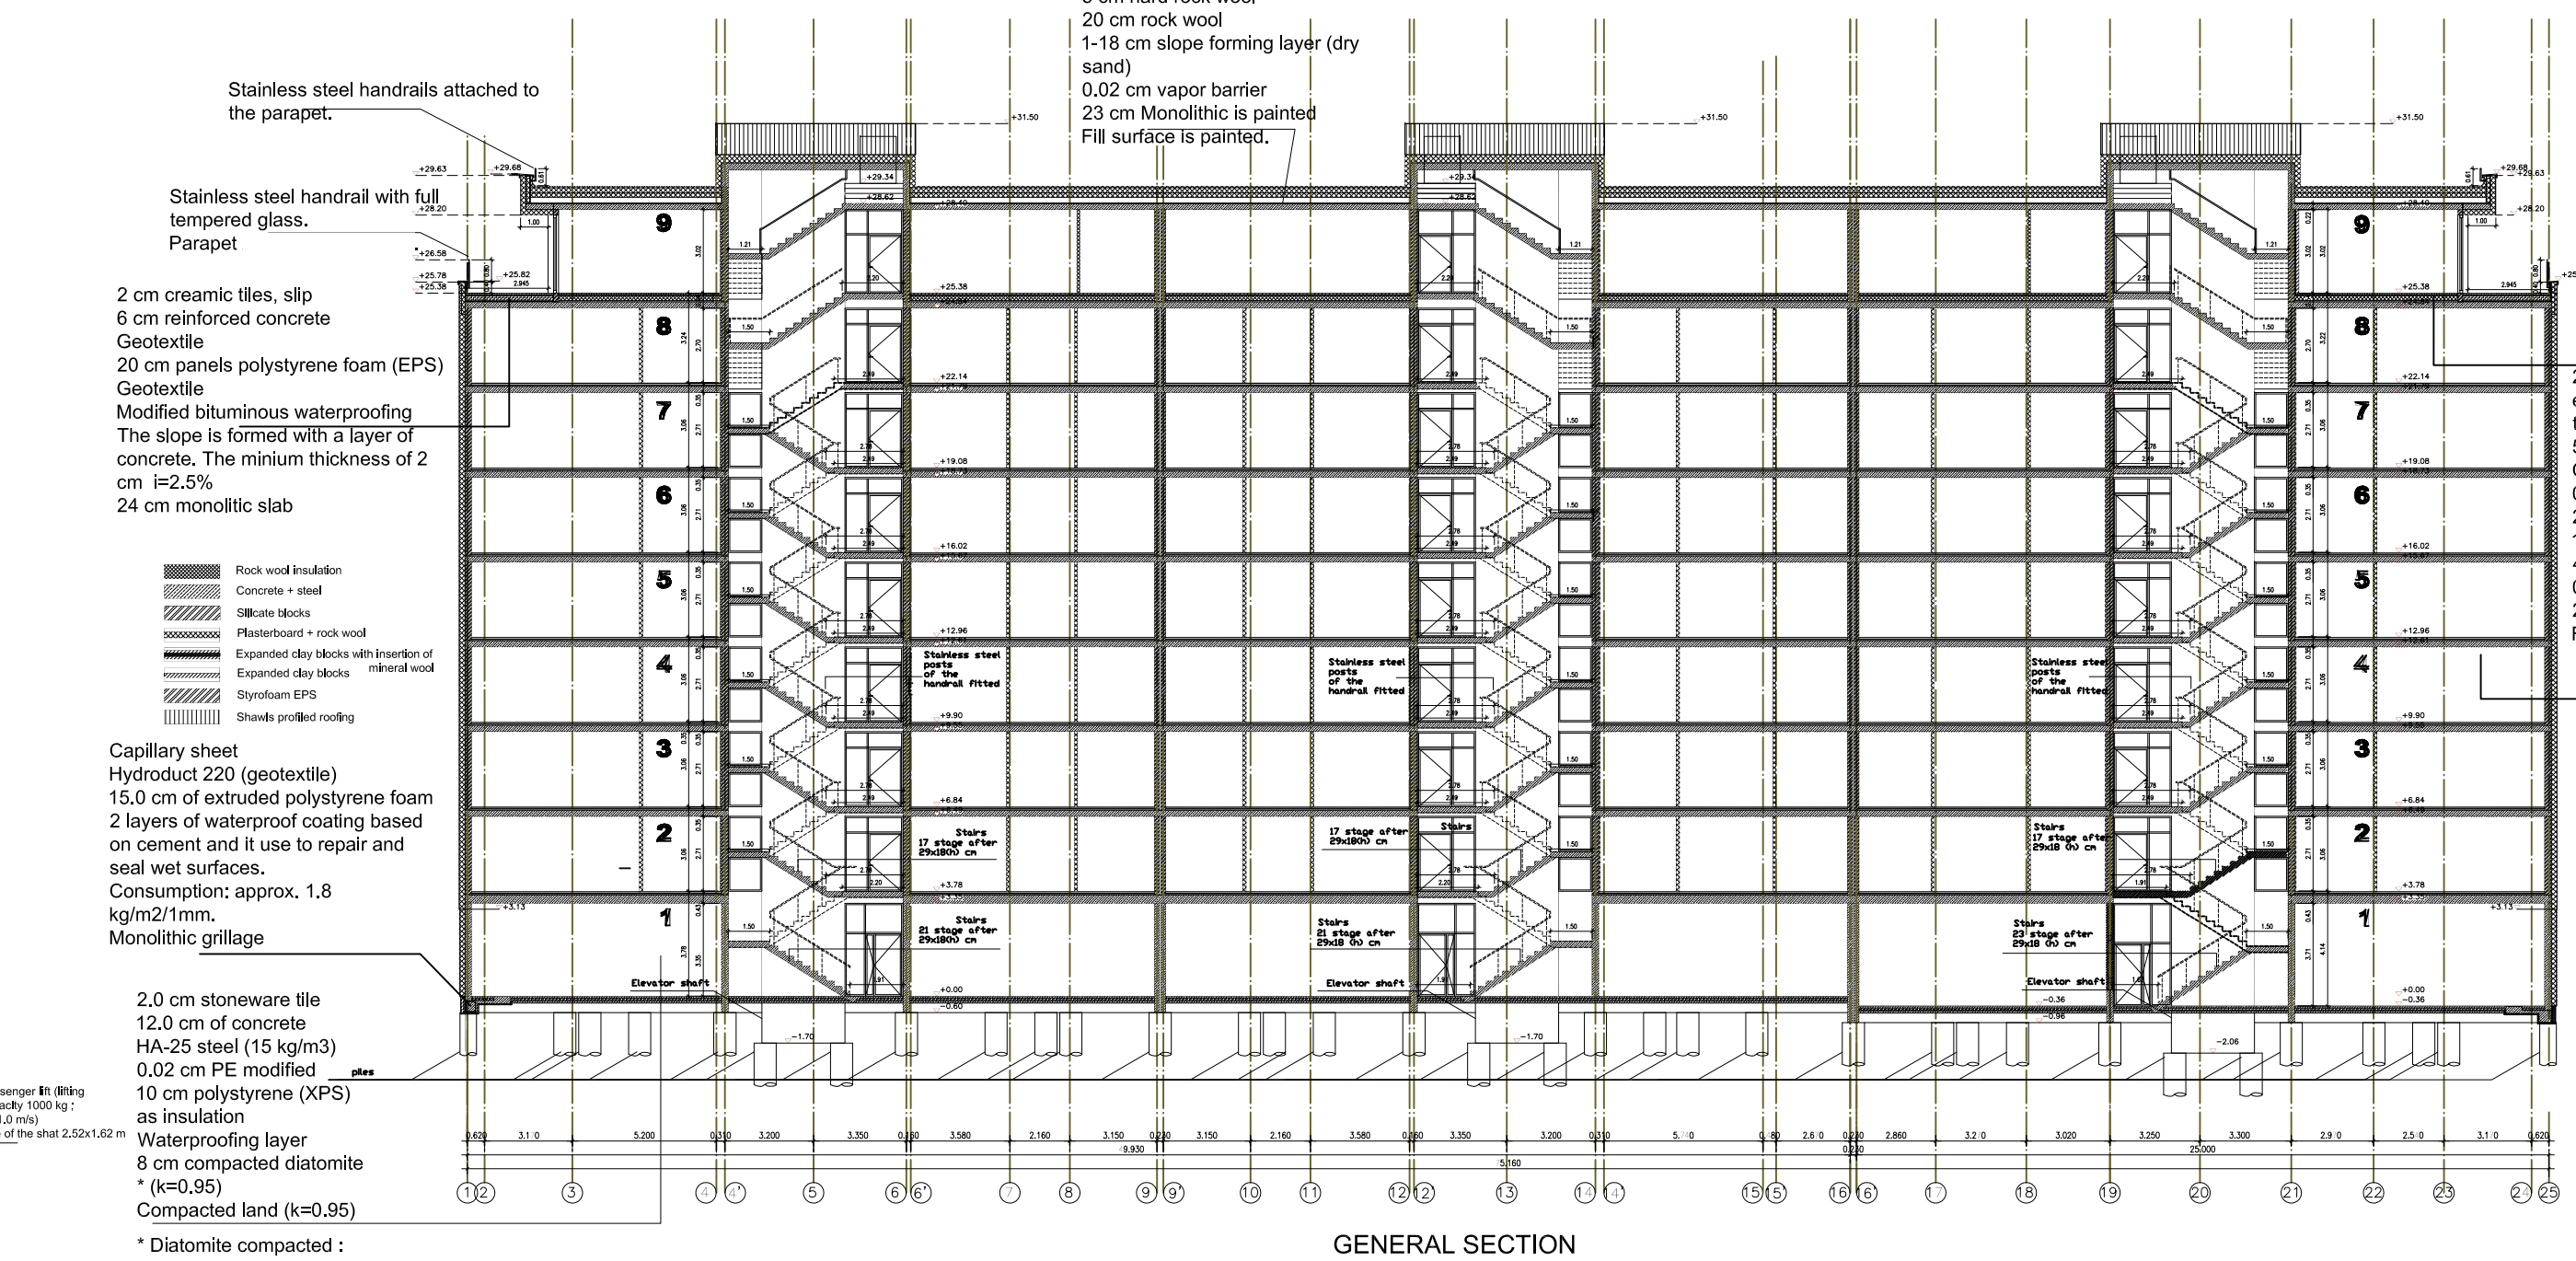

Stainless steel handrail with full tempered glass. Parapet

2 cm ceramic tiles, slip
 6 cm reinforced concrete
 Geotextile
 20 cm panels polystyrene foam (EPS)
 Geotextile
 Modified bituminous waterproofing
 The slope is formed with a layer of concrete. The minimum thickness of 2 cm = 2,5%
 24 cm monolithic slab

Rock wool insulation
 Concrete + sand
 Silicate blocks
 Expanded clay blocks with insulation of expanded clay blocks
 Expanded EPS
 Shanks profiled roofing

Capillary sheet
 Hydroduct 220 (geotextile)
 15,0 cm of extruded polystyrene foam
 2 layers of waterproof coating based on cement and it use to repair and seal wet surfaces.
 Consumption: approx. 1,8 kg/m2/1mm.
 Monolithic grillage

2,0 cm stoneware tile
 12,0 cm of concrete
 HA-25 steel (15 kg/m3)
 0,02 cm PE modified
 10 cm polystyrene (XPS) as insulation
 Waterproofing layer
 8 cm compacted diatomite * (k=0,95)
 Compacted land (k=0,95)
 * Diatomite compacted : cream colored fine powder, used for the manufacture of coatings.

GENERAL SECTION

1,5 cm clinker facade exterior finishes
 adhesive for outdoor use with a mixture of corrosion-resistant armor reinforcing mesh
 +20 cm pressure semi-hard rock wool. Conductivity value of 0,037 W/mk attached with glue and safety pins.
 +18,0-24,0 cm silicate blocks inside a wall covered with mineral plaster

5 cm enhanced fine-grained (gravel)
 - PE modified, Steam insulation (waterproof)
 - 5 cm hard rockwool
 - 20 cm rockwool
 - 1,00-20,0 cm slope forming layer (dry sand)
 - 0,02 cm vapor barrier of PE modified film
 - 23,0 cm monolithic slab and fill surface is painted.

2,0 cm ceramic tiles in rooms with the exception of wetlands, wich coating is tiled.
 5,0 of fine-grained sand reinforced C12/15
 0,02 cm PE modified
 2,0 cm anti-impact sound insulation
 18,0 cm of rock wool insulation
 4,0 cm of dry sand compact
 0,02 cm PE modified
 23,0 cm monolithic slab
 Fill surface is painted

2,0 cm ceramic tiles in rooms with the exception of wetlands, wich coating is tiled.
 5,0 of fine-grained sand reinforced C12/15
 0,02 cm PE modified
 2,0 cm anti-impact sound insulation, acoustic wool,
 4,0 cm of dry sand compact
 0,02 cm PE modified
 23,0 cm monolithic slab
 Fill surface is painted

SECTION STAIRS

5 cm enhanced fine-grained (gravel)
 PE modified like steam insulation (waterproof)
 5 cm hard rock wool
 20 cm rock wool
 1-18 cm slope forming layer (dry sand)
 0,02 cm vapor barrier
 23 cm Monolithic slab
 Fill surface is painted.

1,5 cm clinker as outer facade finishing, adhered with a mixture of grid reinforcement, corrosion resistant.
 18,0 semi-hard rock wool bonded with glue and safety pins.
 Conductivity coefficient 0,037 W / mK
 18,0 /24,0 silicate blocks (masonry)
 Interior finish with mineral plaster and painted later.

Stainless steel handrails with tempered glass filler, stainless steel struts-mounted to the balcony.

1,5 cm clinker as outer facade finishing, adhered with a mixture of grid reinforcement, corrosion resistant.
 18,0 semi-hard rock wool bonded with glue and safety pins.
 Conductivity coefficient 0,037 W / mK
 18,0 /24,0 silicate blocks (masonry)
 Interior finish with mineral plaster and painted later.

Stainless steel handrails with tempered glass filler, stainless steel struts-mounted to the balcony.

1,5 cm clinker as outer facade finishing, adhered with a mixture of grid reinforcement, corrosion resistant.
 18,0 semi-hard rock wool bonded with glue and safety pins.
 Conductivity coefficient 0,037 W / mK
 18,0 /24,0 silicate blocks (masonry)
 Interior finish with mineral plaster and painted later.

Stainless steel handrails with tempered glass filler, stainless steel struts-mounted to the balcony.

6,0 cm concrete blocks
 3,0 cm granite
 15,0 cm of gravel or crushed stone under substrate
 20,0 cm sand substrate

TECHNOLOGICAL CARD I - SLAB

GENERAL INTRODUCTION

The horizontal structural part are solved with the same constructive system. Reinforced concrete slabs is the solution for the 9 floors. The thickness of the slabs is 230 mm except in last floor slab is 220mm of thick. They are composed of HA-25 concrete. The steel consists of a network overlays (upper and lower) of $\phi 12S500/220/\phi 12S500/220$ bars arranged in two orthogonal directions. The armor has different diameters, according to their position and function within the slab.

DESCRIPTION AND SEQUENCE OF WORKS

The basics components of monolithic slab are: concrete HA-25 and iron armors B500S.

CONSTRUCTION SEQUENCE:

- 1- Mark levels.
- 2- Formwork and propping-up. Placement of props on wooden sleepers (wedges), which uniformly distributed load with wood boards that support on metal girders, forming rails. The formwork should contain and support the fresh concrete until cured and retain the desired shape without deforming. It is bound to be rigid, durable, waterproof and clean.
- 3- Stakeout of slab elements.
- 4- Stakeout of gaps.
- 5- Placing armor, including waiting for stairs.
 - 1) Lower armor
 - 2) Lower reinforcement armor
 - 3) Superior armor
 - 4) Superior reinforcement armor
- 6- Separators.
- 7- Pouring, compaction of concrete in slab and vibrated. The fresh concrete poured into the formwork must be made to occur by preventing segregation of the mixture. To do this, the maximum height of pouring concrete is one meter. Is placed in layers of thin horizontal to allow good compacting. To achieve a concrete compacted and thus the elimination of gaps, is made vibrated.
- 8- Concrete curing: Curing is one of the most important operations in the process of laying, since a poorly executed curing can decrease the strength of concrete as well as increase the porosity of the dough favoring the entry of outside environment and reducing therefore, durability of the element.
- 9- Removing of formwork and finishes: Removing formwork is made when the concrete has reached a sufficient hardness. In normal portland usually a period of between 3 and 7 days. Repair small holes or voids generally superficial surface defects. If these defects are large or resistant in critical areas may require partial or total demolition construction

QUALITY CONTROL

Minimum tests to make and frequency of realization

Tests shall be:

- During the execution of structures, often as it indicated below or when I say the Project Management.
- Sampling of fresh concrete, will be held at the time and place of placing concrete in the formwork, under the conditions that the EHE -08 is established.
- After the execution of structures, when necessary verify the results of tests conducted on molded specimens.
- The tests were performed on extracted witnessed by rotary probe structures, supplemented, when so say the Project Management for non-destructive testing or other order to obtain the necessary information.

1. Tests to be performed on fresh concrete:

1.1 Cone of Abrams

1.2 Tests to be performed to determine the characteristics of hardened concrete

1.3. Resistance tests conducted to judge the uniformity and quality of concrete placed at Work

HUMAN SAFETY

Collective protections

- Safety nets.
- Resistant railing 90 cm minimum on each floor height, will have handrails, a interim and baseboard.
- Horizontal networks to protect gaps.
- Safety harness all workers, lifeline.
- Pathways and ramps in the same or different level.

Individual protections

- Approved safety helmet.
- Mono work.
- Costumes for rainy weather.
- Safety footwear.
- Protective footwear.
- Seat belts
- Bright and reflective vests.
- Reinforced leather gloves.
- Mask auto- filter.
- Harness anti - falls for work at height.
- Acoustic Protector.
- Glasses antiparticles or anti- projected screen.

CONSTRUCTION DETAIL OF REINFORCED SLAB

DESCRIPTION PHASES CONCRETING

First the foundation slab (ground floor slab) is made by armed, following the order of phases, as indicated by the drawing. Each phase corresponds to a block. While the foundation slab of Phase III is being made, begins the works to make the slab 1 of phase I. In turn, while the slab 1 of phase III is carried out, it begins to make the slab 2 (first floor slab) Block I (phase I). Following the pattern from right to left, as shown in this scheme.

LEGEND:

1. REINFORCED PLACEMENT.
2. CONCRETE PLACEMENT
3. CONCRETE PUMP
4. PUMP TRUCK

Putzmeister has been chosen 32X -150 pump. With a vertical reach of 32 meters and boom:
 -Length of the first section: 7.7 m // -Length of the second section: 7.05 m // -Length of the third section: 7.05 m
 The fourth section length: 6.2 m

Since we have 75.730 m length of slab, and the maximum range of the arm is 32 m, 3 trucks pump for the entire slab is needed.

ORGANIZATION

TECHNICAL- ECONOMIC INDICATORS

1. Quantity of Works: 813.98 m²
2. Instalation cost: 63873.011 €
3. Duration of Works: 7 days
4. Wage:
 - Official 1st structure: 8 h/d x 7 days = 56 h.
 - 56 h x 18.10 € = 1.013,6 €
 - Structure assistant: 56 h x 16.94 € = 948.64 €

It has made the full financial calculation of the 2nd floor slab as it is "slab type", but the buildings consist of 10 slabs in full:
 - Slab 1-7: 813.98 m²
 - Slab 8: 906.78 m²
 - Slab 9: 644.72 m²
 So, it has to be calculated the totally of money:
 - Slab 1-7: 813.98 m² x 78,47 €/ m² = 63.873,011 x 7 = 447.111,07 €
 - Slab 8: 906.78 m² x 78,47 €/ m² = 71.155,03 €
 - Slab 9: 644.72 m² x 78,47 €/ m² = 50.591,18 €

TOTAL: 447.111,07 + 71.155,03 + 50.591,18 = 568.857,28 €

TECHNOLOGICAL CARD II - ROOF WORKS

GENERAL INTRODUCTION

It is a not passable roof with a finish gravel cover.
The slope is 3.5 % constant over the entire roof.
The total area is 644.72 m2 roof.

The roof consists of the following layers:

- Monolithic reinforced concrete slab
- Layer primer
- PE steam insulation (vapor barrier)
- Layer slope formation of clay (dry sand)
- Regularization layer of mortar 1:8
- 25 cm rigid expanded polystyrene panel
- PE modified waterproof
- Geotextile
- Gravel

HUMAN SAFETY

Collective protections

- Safety nets.
- Resistant railing at least 90 cm, will handrails, intermediate and baseboard.
- The horizontal rails and vertical networks, to protect the holes.
- Safety harness all workers, lifeline.

Individual protections

- Safety helmet with ventilation holes.
- Anti-slip footwear.
- Glasses anti-particles.
- Red adjusted and non-flammable.
- Belts.
- Ames anti-falls for work at height.

QUALITY CONTROL

According to Decree 59/1994 of May 13, which regulates the quality control of the building and its use and maintenance, to define:

- Criteria for receipt of materials to be controlled.
- Lots, test samples and corresponding tests and documentation (certificates, seals, etc.) that suppliers must provide.
- The criteria for acceptance or rejection of lots.

The materials being objective of control, shall comply:

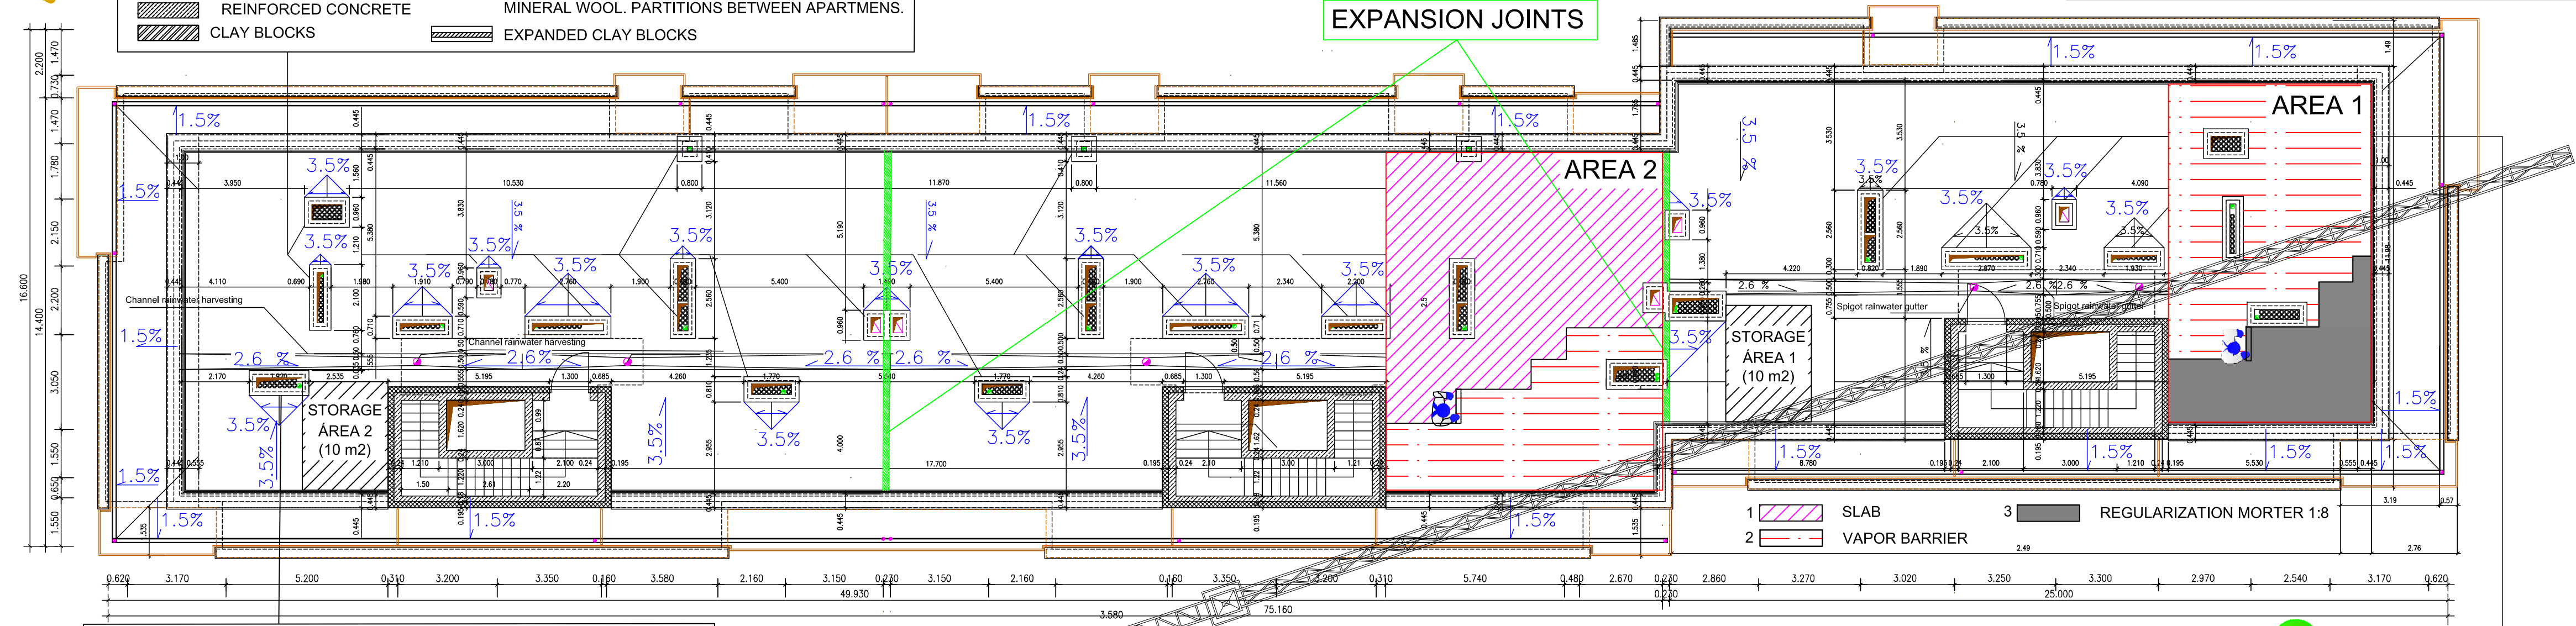

- Criteria reception
- Documentation for the end of the work
- Reception control (documentary control)
- Control execution

The cover must meet the test of sealing service.

CONVENTIONS :

	POLYSTYRENE		PLASTERBOARD + POLYSTYRENE
	REINFORCED CONCRETE		EXPANDED CLAY BLOCKS WITH INSERTION OF MINERAL WOOL. PARTITIONS BETWEEN APARTMENTS.
	CLAY BLOCKS		EXPANDED CLAY BLOCKS

12 cm wall ventilation shafts chimney installation waterproofing
12 cm stone wool insulation roll roofing chimney and roof trims
1 cm coated galvanized steel

DETAIL PARAPET

1.5 cm clinker as outer facade finishing, adhered with a mixture of grid reinforcement, corrosion resistant.
18.0 semi-hard rock wool bonded with glue and safety pins.
18.0 /24.0 silicate blocks (masonry).
Interior finish with mineral plaster and painted later.

DETAIL LAYERS

- 1 - SLAB 23 cm.
- 2 - VAPOR BARRIER
- 3 - EXPANDED CLAY (SLOPE FORMATION)
- 4 - REGULARIZATION LAYER
- 5 - 25 cm EXPANDED POLYSTYRENE PANEL
- 6 - PE MODIFIED, WATERPROOF.

DETAIL DRAIN

- 7 - REINFORCEMENT TO WATERPROOF LAYER
- 8 - GEOTEXTILE
- 9 - GRAVEL
- 10 - DRAIN
- 11 - DRAIN GRATE
- 12 - PIPE
- 13 - FACADE
- 14 - MINERAL WOOL
- 15 - SEPARATION MESH

TECHNICAL-ECONOMIC INDICATORS

1. Quantity of works: 644.72 m2
2. Installation cost: 644.72 m2 x 65.02 € = 41.919,69 €
3. Works duration: 15 days
4. Wage: 8 hours / day x 15 days = 120 h
Official 1st construction: 120 h x 8,36 = 1003.2 €
Construction ordinary laborer: 120 h x 10,94 = 1312.8 €

- Official 1st applicator waterproofing sheets: 2 days x 8 h/d = 16 h --> 16 h x 2.09 = 33.44 €
Assistant applicator waterproofing sheets: 16 h x 1.95 = 31.2 €
Official 1st insulation fitter : 4 d x 8 h/d = 32 h --> 32 h x 0.89 = 28.48 €
Insulation fitter helper: 32 h x 0.81 = 25.92 €

CONSTRUCTION SEQUENCE:

ROOF WORK SEQUENCE:

- Monolithic reinforced concrete slab
- Layer primer
- PE steam insulation
- Layer slope formation of clay (dry sand)
- Regularization layer
- Geotextile
- 25 cm rigid polystyrene
- PE modified (vapor barrier) Waterproof.
- Geotextile
- Gravel

1. Primer coat the entire surface.
2. Stakeout hip roof and valleys roof.
3. Placing insulation layer (PE) on all sides and over the entire surface of the slab and fixing air conduct.
4. Placement manufactures edge (protruding structure) and sealed
5. Execution of valleys roof and hip roof.
6. Execution of slope formation.
7. Layer regularization.

8. Geotextile.
9. Polystyrene 25 cm

10. PE modified, waterproofing.
11. Geotextile.
12. Gravel.

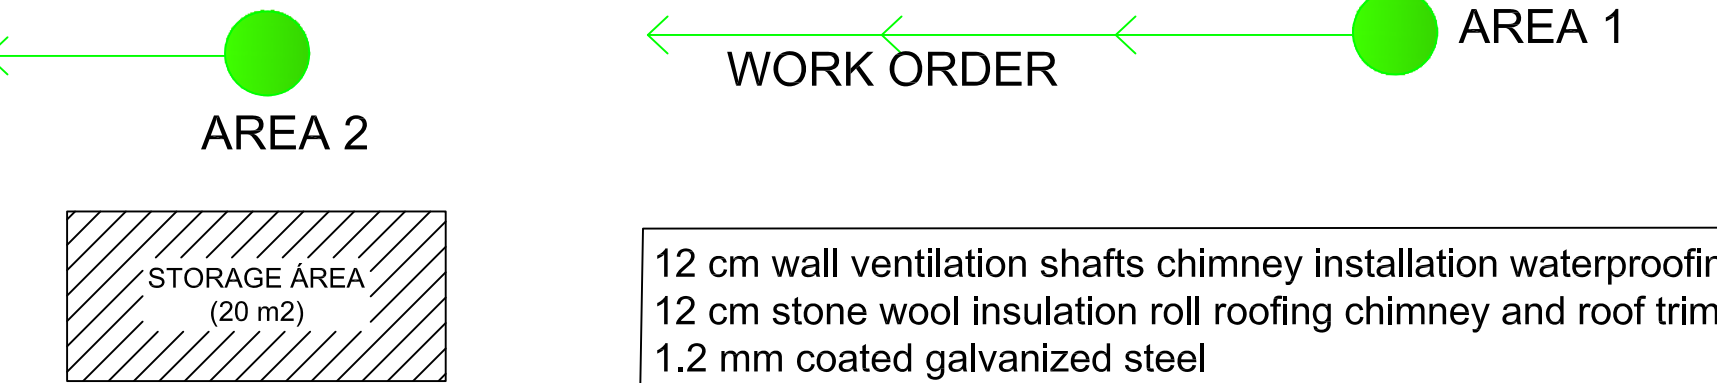

FIXED ANCHOR (EN-795 Clase A1, Spanish Normative).

The works on roof be carried out under measures preventive safety for workers:

- Protective fence
- Each worker have to be tied by a line of life to a fixed anchor point which will be affixed to slab.
- Therefore, every worker in addition to the individual protections, take a safety harness, coupled with a lifeline which one is fixed point of anchorage.

- The Railing perimeter protection of stairwells will be placed around its perimeter.
- The rail "sargento" protection type will be placed on all floors.
- The Horizontal network of protection will be placed along all the floors, attached by struts.
- The Gallows type network, will be placed only on the last floor to prevent objects from falling into the void.
- The line of life, will be placed at the last floor. Operators keep a safety harness hooked to the lifeline. Thus, in the case of a fall, the operator will be assured with it.

Due to the high percentage of rain in Vilnius (Lithuania), the vapor barrier should be placed immediately after placing the thermal insulation, so the day was divided into hours, and in the same way, the layer of thermal insulation (polystyrene 25 cm), and immediately after placement of the vapor barrier will take place. The duration will be:
- Four for thermal insulation (per day).
- Four hours a vapor barrier (per day).
So, the eight hours of work a day are achieved.

CONSTRUCTION MASTER PLAN

1. Building object of construction	6. Fence	11. Waste and recidity container	16. Temporary electricity supply counter
2. Existing buildings	7. Restroom	12. Advertising board	17. Temporary gas supply counter
3. Crane	8. Dinning room	13. Exterior storage area	18. Temporary sewage system
4. Acces vehicles	9. Changing room	14. Warehouse equipment	19. Step machinery within plot
5. Personal gates	10. Technical office	15. Temporary water supply counter	20. Direct path of gateway to temporary buildings for workers

Temporary lighting	Fence	Direct path of gateway to temporary buildings for workers
Limits building	Advertising board	Temporary water and electricity supply counter
Crane	Temporary wastewater network connection	Trespassing signal is output vehicles
Acces vehicles	Temporary drinking water network connection	Security control in each enter
Limits building	Temporary electrical underground cable network connection	Road to workers to go to temporal buildings and work area

Near provisional for the delimitation of the work area perimeter . Its dimensions will be : 3.50 x 2.00 m .
The cables are galvanized and:
- Horizontal : 5 mm in diameter
- Vertical : 4 mm in diameter
The concrete prefabricated base is : 65 x 24 x 12 cm and it has 6 holes for the posts.
To avoid the visibility of the work from the outside one mesh of green polyethylene is used...

Parameters that are going to condition the choice of the crane:
- Minimum range of 46.52 m to sweep all our work.
- Minimum height under hook of 31.50 m more security separation 3m = 34.50 m.
- The foundation of the crane will be 3.60x1.89 m.
- It must provide for the positioning of a rotation limiter.

Other parameters to consider:
- The maximum and peak load must be at least a 1500 kg around the perimeter of the site to run (approximately a beaker filled with concrete weight).
- The speed of work, but does not determine us the choice of the crane can save time in implementation.
- The weight of the crane can also be decisive in choosing the equipment to be mounting.

ECONOMIC CALCULATION

ECONOMIC CALCULATION

General budget of the whole work explained and accompanied by the necessary tables " CYPE " which was able to take the price operations.

All information used here to make the budget work is taken from a Spanish website " Generator Prices CYPE " therefore , all tables in which the decomposition of leaves each game performance , unit price and cost , It has been translated manually.

<http://www.generadordeprecios.info>

Example of interior carpentry : doors

http://www.generadordeprecios.info/obra_nueva/L_Carpinteria_vidrios_y_protecciones/Puertas/De_madera/Puerta_de_pas_o_de_madera.html

CLEARING

4470 m²

4470 x 0,73 = **3129 €**

ADL005 m² Clearing and clearance

Clearing and clearance, using mechanical facilities, removal of excavated materials and truck load, not including transportation to an authorized landfill.

Descomposed	Ud	Descomposition	Yield	Unit price (€)	Cost (€)
mq01pan010a mo111	h	Loader on tires of 120 kW/1,9 m ³ .	0,015	40,13	0,60
	h	Worst ordinary construction	0,006	15,92	0,10
	%	Aids	2,000	0,70	0,01
	%	Indirect costs	3,000	0,71	0,02
				Total:	0,73

EXCAVATION

The excavation will be different in a block of the other two , since the block I, begins in elevation -0.36 , therefore , it is held in an excavation :

- Block I (14,400 x 25 m): -0.96 m
- Block II and III (49,930 x 14,400 m) : -0.36 m
- 3 Elevators (1.70 x 3.70 m): -1.70 m

Total excavation :

$$14,400 \times 25 = 360 \text{ m}^2$$

$$49,930 \times 14,400 = 718.9 \text{ m}^2$$

$$1.70 \times 3.70 = 6.29 \text{ m}^2$$

$$360 \times 0.96 = 345.6 \text{ m}^3$$

$$718.9 \times 0.36 = 258.8 \text{ m}^3$$

$$6.29 \times 1.70 = 10.7 \times 3 = 32.1 \text{ m}^3$$

$$345.6 + 258.8 + 32.1 = 636.5 \text{ m}^3$$

$$23,71 \times 636.5 = \mathbf{15.091,41 \text{ €}}$$

ADE010 m³ Digging.

Mechanically removing excavated materials and truck loading.

%	Indirect costos	3.000	76.18	2.29
			TOTAL METERS X	78.47
			TOTAL METERS	813.98
			TOTAL PRICE	63873.011

**Decennial maintenance cost: 3.92€ in the first 10 years.

TOTAL COST FOR SECOND FLOOR: 63.873,011 €

SURFACES CHEKING OF SECOND FLOOR:

- 1) Common área: 67,12 m²
 - Rooms apartment: 61,1 m²
 - Rooms apartment: 67,98 m²
 - Rooms apartment: 51,67 m²
 - Rooms apartment: 67,5 m²

TOTAL: 67,12 + 61,1 + 67,98 + 51,67 + 67,5 = 315,37 m²

- 2) Rooms apartment: 67,36 m²
 - Rooms apartment: 51,60 m²
 - Rooms apartment: 51,60 m²
 - Rooms apartment: 71,34 m²

TOTAL : 67,36 + 51,60 + 51,60 + 71,34 = 242,9 m²

- 3) Rooms apartment: 74,74 m²
 - Rooms apartment: 51,55 m²
 - Rooms apartment: 68,88 m²
 - Rooms apartment: 61,54 m²

TOTAL: 74,74 + 51,55 + 68,88 + 61,54 = 256,71 m²

TOTAL SECOND FLOOR: 315,37 + 242,9 + 256,71 = 813,98 m²

TECHNICAL- ECONOMIC INDICATORS

1. Quantity of Works: 813.98 m²
2. Instalation cost: 63873.011 €
3. Duration of Works: 7 days
4. Wage:

- Official 1st structure :

8 h/d x 7 days = 56 h.

56 h x 18.10 € = 1.013,6 €

- Structure assistant:

56 h x 16.94 € = 948.64 €

It has made the full financial calculation of the 2nd floor slab as it is " slab type " , but the buildings consist of 10 slabs in full:

- Slab 1-7: 813.98 m²
- Slab 8: 806.78 m²
- Slab 9: 644.72 m²

So, it has to be calculated the totally of money:

- Slab 1-7: 813.98 m² x 78,47 €/ m² = 63.873,011 x 7 = 447.111,07 €
- Slab 8: 806.78 m² x 78,47 €/ m² = 63.308,03 €
- Slab 9: 644.72 m² x 78,47 €/ m² = 50.591,18 €

TOTAL: 447.111,07 + 63.308,03 + 50.591,18 = **561.010,26 €**

WALLS

Silicate blocks:

$$75,160 + 16,295 = 91,45 \text{ m}$$

$$91,45 \times (29,60 - 3.35) = 2400,56 \text{ m}^2$$

$$32,54 \times 2400,56 = \mathbf{78114,30 \text{ €}}$$

On the ground floor , unlike the rest of the floors , there is a bearing wall :
18.0 /24.0 cm monolithic wall.

Load bearing wall structure

In such structures , the vertical elements supporting the slab are the masonry walls , in this case Termoarcilla .

This structural system has two types of vertical elements: load bearing walls . Above them directly supports the slab.

They are perpendicular to the bearing walls and are required to withstand horizontal actions.

The height and thickness of the wall is : 3.35 h.

Wall length:

$$75.160 + 16,295 = 91,45 \text{ m}$$

$$91.45 \times 2 = 182.91 \text{ m}$$

$$182.91 \times 3.35 = 612,72 \text{ m}^2$$

$$612,72 \times 32,54 = \mathbf{19937,7 \text{ €}}$$

FFR040**m²****Interior facade sheet , block factory

INSTALLING FIRE

Installing fire for dry column will be placed.

Dry column system is used in buildings over 25 m . height , for a more rapid intervention by the public forces of extinction. They are enforceable by order of the Ministry of Housing of 02/26/74 (BOE No 53 of 03.02.74) in buildings over 8 floors or on the ground whose height exceeds 25 meters.

TECHNICAL CHARACTERISTICS

Supply and installation of dry column consists of the following elements: 1 outlet IPF-41 provided Siamese connection with embedded keys and type fittings UNE 23400-3, 70 mm (2 1/2 ") diameter with lids subject in bleed key chains and 25 mm in diameter, housed in metal box 590 mm wide, 440 mm high and 300 mm deep, located in front and provided with white painted metal door with the inscription "FIRE USE ONLY" in red letters, 3 outlets in floor (2 IPF-39 include Siamese connection with embedded keys and type fittings UNE 23400-2, 45 mm (1 1/2 ") diameter with lids fastened with string, housed in metal box 590 mm wide, 350 mm high and 300 mm deep, located on the landings of the stairs and provided with glass door with the inscription "FIRE USE ONLY" in red letters, 1 IPF-40 connection provided Siamese with built-handle fittings and UNE 23400-2, 45 mm (1 1/2 ") diameter with lids fastened with string, housed in metal box 590 mm wide, 640 mm high and 300 mm deep, **four plants located** in the landings of the stairs and provided with glass door with the inscription "FIRE USE ONLY" in red letters, sectioning locked located above the corresponding Siamese connection and housed in the same box) with pipes galvanized steel 3 "DN 80 mm, without lag, clamps, fasteners, drain valve, fittings and accessories. Even colorless moon. Fully assembled, and tested conexionada by the installation company by supporting evidence of service (included in the price).

The building has nine floors, so it will be necessary to place 2 dry columns.
Every fourth floor and second on the eighth floor .

$3114,17 \times 2 = \mathbf{6228,34 \text{ €}}$

IOC010**Ud Dry column .**

Dry column consists of the following elements: 1 outlet IPF -41 housed in front ; Three outlets in floor (2 IPF IPF -39 to 1 -40 with key section)

PARTITIONS AND MASONRY

- Inside apartments: 10 partitions of plasterboard.

61,07 x 3 blocks = 183,21 m

h: 28,4 - 4,32 (slab and soil) = 24,1 m (h)

183,21 x 24,1 = 4415,36 m

22,91 x 4415,36 = **101.155,89 €**

- The dividing wall between blocks : 2 partitios of ceramic brick and rock wool.

(11,23 x 28,40) x 2 = 637,86 m

19,90 x 637,86 = 12.693,414 €

6,37 x (11,23 x 28,40) = 2.031,59 m

12.693,414 + 2.031,59 = **14.725,01 €**

-Partition between houses: silicate

41,56 x 3 blocks = 124,68 m/floor

h: 28,4 - 4,32 (slab and soil) = 24,1 m (h)

124,68 x 24,1 = 3004,8 m

3004,8 x 21,24 = **63.821,952 €**
