4. ACCIONES A CONSIDERAR
5. CARACTERÍSTICAS DE LOS MATERIALES
6. SITUACIONES DEL PROYECTO
7. CÁLCULO ESTRUCTURAL
 - 7.1. PASARELA
 - 7.2. ACCESO GODELLA
 - 7.3. ACCESO CAMPOLIVAR
8. MEDICIONES
 - 8.1. RESUMEN MEDICIONES
 - 8.2. MEDICIONES SUPERFICIE

1. OBJETO

El objeto del presente documento es la descripción y definición los apoyos tanto de la pasarela como de los accesos de ésta, procediéndose al dimensionamiento, justificación y comprobación de cada uno de los elementos que conforman los apoyos de la estructura. Dichos cálculos se realizan de acuerdo con la normativa vigente y mediante los procedimientos actualmente aceptados.

Así como la definición de las pendientes y longitudes, establecidas para el diseño de los accesos, y determinación de las características que debe cumplir la iluminación aplicada.

2. DESCRIPCIÓN DE PROCEDIMIENTO

Para realizar el análisis estructural del presente trabajo, utilizaremos el programa informático de cálculo estructural CYPE, para facilitar el cálculo dividiremos la estructura en tres partes, la pasarela, el acceso desde Godella y el acceso desde Campolivar.

Reproduciremos la geometría de la estructura metálica utilizando las cotas obtenidas en el modelo de AutoCAD realizado en 3D. Posterior mente introduciremos las cargas pertinentes para el cálculo por normativa.

Para realizar el cálculo de estas tres partes por separado primero calcularemos la pasarela y obtendremos los esfuerzos transmitidos sobre los puntos de apoyo de los estribos, con estos datos introducidos en los puntos de apoyos de la pasarela, realizaremos los cálculos estructurales de los accesos.

3. NORMATIVA

Para la redacción de este documento se han seguido las siguientes Normas e Instrucciones:

- Norma IAP-11, Instrucción sobre las acciones a considerar en el Proyecto de Puentes de Carretera.

En ella se contempla las acciones para pasarelas peatonales, ciclistas, etc.

- Eurocódigo 1. Acciones en estructuras.
- Norma de Construcción Sismorresistente: Puentes (NCSP-07). Para las acciones sísmicas.

Pasarelas metálicas:

- Instrucción de Acero Estructural EAE-11. Para las pasarelas metálicas de acero laminado.
- Eurocódigo 3. Proyecto de estructuras de acero.
- Código técnico de la edificación. CTE. Documento Básico SE-A Seguridad Estructural. Acero.

4. ACCIONES A CONSIDERAR

4.1. ACCIONES PERMANENTES

Las acciones permanentes son aquellas producidas por el resto de los distintos elementos que forman parte de la pasarela. Corresponden a acciones que actúan en todo momento y son constantes en posición. Para hallar la carga distribuida que se da en cada sección.

4.2. PESO PROPIO

Esta acción corresponde al peso de los elementos estructurales teniendo en cuenta la sección bruta y el peso específico del material. A continuación se detalla el peso específico del material de las losas de hormigón pretensado.

4.2.1. CARGA MUERTA

Se consideran las cargas debidas a los elementos no estructurales que gravitan sobre la estructura, entre ellos se encuentran: pavimentos, iluminación, impostas, barreras, conductos de servicios, etc.

4.3. ACCIONES VARIABLES

4.3.1. SOBRECARGA DE USO

En las sobrecarga de uso se consideran las acciones externas a la estructura que pueden actuar en toda o parte de la pasarela; dependiendo de si es más o menos desfavorable su consideración.

Según la IAP-11 debe tenerse en cuenta una sobrecarga de uso debida al tráfico de peatones de valor igual a $q = 5 \text{ kN/m}^2$.

4.3.2. EMPUJE SOBRE BARANDILLAS Y BARRERAS

Para la comprobación resistente de la barandilla y sus anclajes se debe considerar un empuje horizontal sobre el pasamanos de la misma.

El esfuerzo que debe tenerse en cuenta es una fuerza horizontal distribuida de $1,5 \text{ kN/m}$; considerándose a la altura del pasamanos siempre que está sea inferior a 1,5 metros.

Remarcar que esta acción tiene carácter local y por ello se utilizará únicamente para la comprobación de la barandilla y no se tendrá en cuenta para ningún otro cálculo a nivel global.

4.3.3. NIEVE

Debido al emplazamiento de la pasarela no se tendrá en cuenta la acción de la nieve; ya que no hay riesgo de grandes nevadas; aún con todo habiéndose considerado la acción de la sobrecarga por toda la superficie del tablero sería suficiente.

4.4. ACCIONES ACCIDENTALES

4.4.1. IMPACTO DE VEHÍCULOS

No se consideran estas acciones al no permitirse el tráfico de vehículos sobre la misma.

4.4.2. ACCIÓN SÍSMICA

La acción sísmica se considerará en proyecto de pasarelas de acuerdo con las prescripciones recogidas en la Norma de Construcción Sismorresistente de Puentes (NSCP-07). La aplicación de esta norma es obligatoria, salvo en edificaciones de importancia normal o cuando la aceleración sísmica básica (a_b) sea menor a $0,04g$.

La aceleración sísmica horizontal básica (a_b) depende del emplazamiento de la obra; al encontrarse la misma en Requena (interior de la Comunidad Valenciana), no se ha tenido esta acción, ya que se encuentra en una zona donde el factor a_b es menor a $0,04g$. En la Figura 1 puede verificarse:

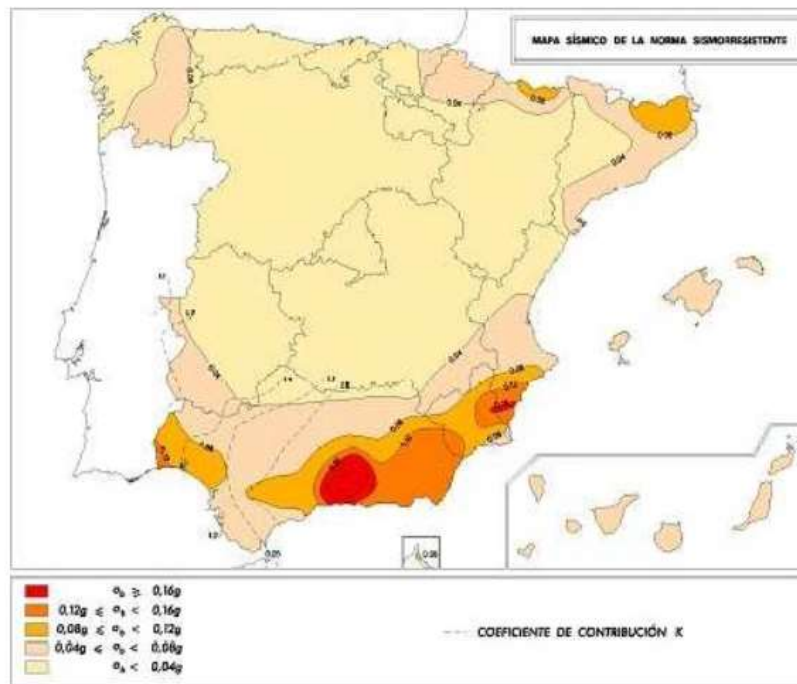

Figura 1. Mapa de peligrosidad sísmica (aceleraciones)

5. CARACTERÍSTICAS DE LOS MATERIALES

Materiales utilizados							
Material		E	ν	G	f_y	α_t	γ
Tipo	Designación	(kp/cm ²)		(kp/cm ²)	(kp/cm ²)	(m/m°C)	(t/m ³)

6. SITUACIONES DEL PROYECTO

Para las distintas situaciones de proyecto, las combinaciones de acciones se definirán de acuerdo con los siguientes criterios:

- Con coeficientes de combinación

$$\sum_{j \geq 1} \gamma_{Gj} G_{kj} + \gamma_P P_k + \gamma_{Q1} \Psi_{p1} Q_{k1} + \sum_{i > 1} \gamma_{Qi} \Psi_{ai} Q_{ki}$$

- Sin coeficientes de combinación

$$\sum_{j \geq 1} \gamma_{Gj} G_{kj} + \gamma_P P_k + \sum_{i \geq 1} \gamma_{Qi} Q_{ki}$$

- Donde:

G_k Acción permanente

P_k Acción de pretensado

Q_k Acción variable

g_G Coeficiente parcial de seguridad de las acciones permanentes

g_P Coeficiente parcial de seguridad de la acción de pretensado

$g_{Q,1}$ Coeficiente parcial de seguridad de la acción variable principal

$g_{Q,i}$ Coeficiente parcial de seguridad de las acciones variables de acompañamiento

$\gamma_{p,1}$ Coeficiente de combinación de la acción variable principal

$\gamma_{a,i}$ Coeficiente de combinación de las acciones variables de acompañamiento

Para cada situación de proyecto y estado límite los coeficientes a utilizar serán:

E.L.U. de rotura. Hormigón en cimentaciones: EHE-08 / CTE DB-SE C

Persistente o transitoria				
	Coeficientes parciales de seguridad (γ)		Coeficientes de combinación (ψ)	
	Favorable	Desfavorable	Principal (ψ_p)	Acompañamiento (ψ_a)
Carga permanente (G)	1.000	1.600	-	-
Sobrecarga (Q)	0.000	1.600	1.000	0.700
Viento (Q)	0.000	1.600	1.000	0.600

E.L.U. de rotura. Acero laminado: CTE DB SE-A

Persistente o transitoria				
	Coeficientes parciales de seguridad (γ)		Coeficientes de combinación (ψ)	
	Favorable	Desfavorable	Principal (ψ_p)	Acompañamiento (ψ_a)
Carga permanente (G)	0.800	1.350	-	-
Sobrecarga (Q)	0.000	1.500	1.000	0.700
Viento (Q)	0.000	1.500	1.000	0.600

Tensiones sobre el terreno

Característica				
	Coeficientes parciales de seguridad (γ)		Coeficientes de combinación (ψ)

Sobrecarga (Q)	0.000	1.000	1.000	1.000
Viento (Q)	0.000	1.000	1.000	1.000

7. CÁLCULO ESTRUCTURAL

Para realizar el cálculo estructural utilizaremos el programa CYPE metal, se ha introducido en el programa un modelo en tres dimensiones de la estructura a calcular dividiendo el trabajo en tres partes, la primera está formada por estribo y pasarela, en esta parte comprobamos la resistencia estructural de las vigas en arco y obteniendo los esfuerzos transmitidos por estas a los estribos.

Las otras dos partes corresponden a cada uno de los accesos, obtendremos los resultados de la escalera y rampa, y para completar el cálculo de los estribos introducimos los esfuerzos calculados sobre estos de la pasarela.

Este punto está dividido en cuatro partes, en cada una de ellas encontraremos un esquema unifilar de la estructura calculada así como las cargas introducidas para el cálculo y las secciones resistentes utilizadas.

η : Aprovechamiento de la resistencia. La barra cumple con las condiciones de resistencia de la norma si se cumple que $\eta \geq 100$ %.

Notación:

λ : Limitación de esbeltez
 λ_w : Abolladura del alma inducida por el ala comprimida
 N_t : Resistencia a tracción
 N_c : Resistencia a compresión
 M_y : Resistencia a flexión eje Y
 M_z : Resistencia a flexión eje Z
 V_z : Resistencia a corte Z
 V_y : Resistencia a corte Y
 M_yV_z : Resistencia a momento flector Y y fuerza cortante Z combinados
 M_zV_y : Resistencia a momento flector Z y fuerza cortante Y combinados
 NM_yM_z : Resistencia a flexión y axil combinados
 $NM_yM_zV_yV_z$: Resistencia a flexión, axil y cortante combinados
 M_t : Resistencia a torsión
 M_tV_z : Resistencia a cortante Z y momento torsor combinados
 M_tV_y : Resistencia a cortante Y y momento torsor combinados
 x : Distancia al origen de la barra
 η : Coeficiente de aprovechamiento (%)
 N.P.: No procede

Comprobaciones que no proceden (N.P.):

- (1) La comprobación no procede, ya que no hay axil de compresión.
- (2) La comprobación no procede, ya que no hay momento torsor.
- (3) No hay interacción entre momento torsor y esfuerzo cortante para ninguna combinación. Por lo tanto, la comprobación no procede.
- (4) La comprobación no procede, ya que no hay axil de tracción.
- (5) La comprobación no procede, ya que no hay momento flector.
- (6) La comprobación no procede, ya que no hay esfuerzo cortante.
- (7) No hay interacción entre momento flector y esfuerzo cortante para ninguna combinación. Por lo tanto, la comprobación no procede.

7.2. ACCESO CAMPOLIVAR

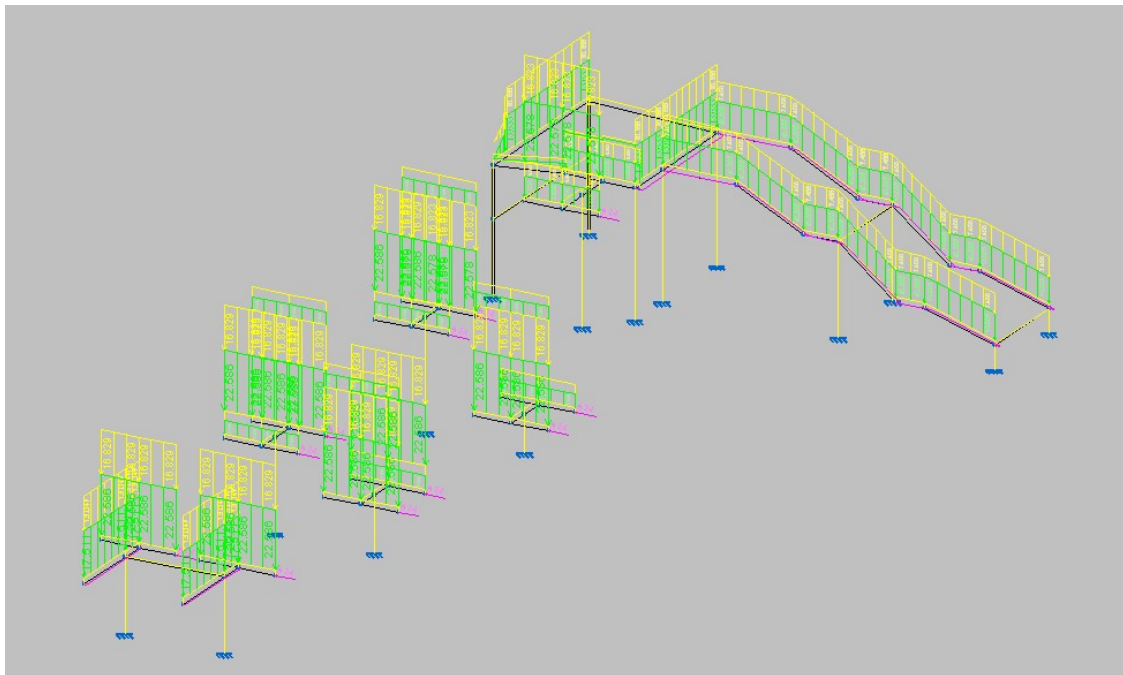

Imagen 2. Cargas consideradas para dimensionamiento del acceso Campolivar

Resultados barras

Referencias:

N: Esfuerzo axil (t)

V_y: Esfuerzo cortante según el eje local Y de la barra. (t)

Vz: Esfuerzo cortante según el eje local Z de la barra. (t)

Mt: Momento torsor (t·m)

My: Momento flector en el plano 'XZ' (giro de la sección respecto al eje local 'Y' de la barra). (t·m)

Mz: Momento flector en el plano 'XY' (giro de la sección respecto al eje local 'Z' de la barra). (t·m)

Los esfuerzos indicados son los correspondientes a la combinación pésima, es decir, aquella que demanda la máxima resistencia de la sección.

Origen de los esfuerzos p_{es}imos:

- G: Sólo gravitatorias
- GV: Gravitatorias + viento
- GS: Gravitatorias + sismo
- GVS: Gravitatorias + viento + sismo

η : Aprovechamiento de la resistencia. La barra cumple con las condiciones de resistencia de la norma si se cumple que $\eta \geq 100$ %.

Notación: $\bar{\lambda}$: Limitación de esbeltez λ_w : Abolladura del alma inducida por el ala comprimida N_t : Resistencia a tracción N_c : Resistencia a compresión M_Y : Resistencia a flexión eje Y M_Z : Resistencia a flexión eje Z V_Z : Resistencia a corte Z V_Y : Resistencia a corte Y $M_Y V_Z$: Resistencia a momento flector Y y fuerza cortante Z combinados $M_Z V_Y$: Resistencia a momento flector Z y fuerza cortante Y combinados $N M_Y M_Z$: Resistencia a flexión y axil combinados $N M_Y M_Z V_Y V_Z$: Resistencia a flexión, axil y cortante combinados M_t : Resistencia a torsión $M_Y V_Z$: Resistencia a cortante Z y momento torsor combinados $M_Y V_Y$: Resistencia a cortante Y y momento torsor combinados x : Distancia al origen de la barra η : Coeficiente de aprovechamiento (%) N.P.: No procede																
Comprobaciones que no proceden (N.P.): ⁽¹⁾ La comprobación no procede, ya que no hay axil de tracción. ⁽²⁾ La comprobación no procede, ya que no hay esfuerzo cortante. ⁽³⁾ No hay interacción entre momento flector y esfuerzo cortante para ninguna combinación. Por lo tanto, la comprobación no procede. ⁽⁴⁾ La comprobación no procede, ya que no hay momento torsor. ⁽⁵⁾ No hay interacción entre momento torsor y esfuerzo cortante para ninguna combinación. Por lo tanto, la comprobación no procede. ⁽⁶⁾ La comprobación no procede, ya que no hay momento flector. ⁽⁷⁾ La comprobación no procede, ya que no hay axil de compresión. ⁽⁸⁾ La comprobación no procede, ya que no hay axil de compresión ni de tracción. ⁽⁹⁾ No hay interacción entre axil y momento flector ni entre momentos flectores en ambas direcciones para ninguna combinación. Por lo tanto, la comprobación no procede. ⁽¹⁰⁾ No hay interacción entre momento flector, axil y cortante para ninguna combinación. Por lo tanto, la comprobación no procede.																

7.3. ACCESO GODELLA

Imagen 3. Cargas consideradas para dimensionamiento del acceso Godella

Resultados barras

Referencias:

N: Esfuerzo axial (t)

Vy: Esfuerzo cortante según el eje local Y de la barra. (t)

Vz: Esfuerzo cortante según el eje local Z de la barra. (t)

Mt: Momento torsor (t·m)

My: Momento flector en el plano 'XZ' (giro de la sección respecto al eje local 'Y' de la barra). (t·m)

Mz: Momento flector en el plano 'XY' (giro de la sección respecto al eje local 'Z' de la barra). (t·m)

Los esfuerzos indicados son los correspondientes a la combinación pésima, es decir, aquella que demanda la máxima resistencia de la sección.

Origen de los esfuerzos pèsimos:

- G: Sólo gravitatorias
- GV: Gravitatorias + viento
- GS: Gravitatorias + sismo
- GVS: Gravitatorias + viento + sismo

η : Aprovechamiento de la resistencia. La barra cumple con las condiciones de resistencia de la norma si se cumple que $\eta \geq 100$ %.
