Abstract -1-

Resumen -3-

Resum -5-

General introduction -7-

The background of animal nutrition and breeding briefly -9-

Defining the theoretical framework -12-

The rabbit female -16-

Nutrition and resource allocation -16-

Genetics and resource allocation -18-

Statistical approach -21-

Hypothesis and objectives -25-

Paper I: Accounting for (co)variance structure of longitudinal data from traits associated to productive performance in reproductive rabbit females: Model fitting and performance -33-

Abstract -35-

Introduction -37-

Materials and methods -38-

Animals and experimental procedure -38-

Traits and data -38-

Statistical analysis -39-

Results and discussion -45-

Structures considering residual variation exclusively: Group 1 -46-

Structures including variation between animals: Group 2 -51-

Structures including variation between lactations from a given animal: Group 3 -53-

Conclusions -54-

Acknowledgments -54-

References -55-

Paper II: Homeorhetic control and homeostatic regulation from a mixed-model view: Reinterpreting nutrient partitioning using the rabbit female as a model -57-

Abstract -59-

Introduction -61-

Materials and methods -62-

Animals and experimental procedure -62-

Traits -63-

Statistical analysis -64-

Results -66-
Evolution of traits over the reproductive cycle -66-
Relations among traits -68-
Discussion -69-
(Co)Variation between animals and the homeorhetic control -69-
Covariation within animals and homeostatic regulation -72-
Body condition under this framework -75-
Conclusions -75-
Acknowledgments -76-
References -76-

Paper III: Long-term implications of fitting feed energy source to the genetic type in reproductive rabbit females I. Resource acquisition and allocation -79-
Abstract -81-
Introduction -83-
Materials and methods -84-
Animals -84-
Diets -85-
Experimental procedure -86-
Traits -86-
Statistical analysis -87-
Results -88-
Acquisition and allocation of resources -88-
Blood plasma parameters -93-
Discussion -95-
General pattern of acquisition and allocation of resources -95-
Acquisition and allocation patterns of genetic types -96-
Primiparous females -98-
Conclusions -99-
Acknowledgments -100-
References -100-

Paper IV: Long-term implications of fitting feed energy source to the genetic type in reproductive rabbit females III. Fitness and productivity -105-
Abstract -107-
Introduction -109-
Materials and methods -109-
Animals -110-
Diets -110-
Experimental procedure -110-

Traits -111-
Statistical analysis -111-
Results -112-
Discussion -116-
Energy source -116-
Genetic type -117-
Genetic type x energy source and the genetic background -118-
Conclusions -121-
Acknowledgments -121-
References -121-
General discussion -125-
Statistical approach -127-
The role of the animal and the effect of energy source -127-
Optimizing resource allocation to the genetic type -129-
References -132-
Conclusions -135-
Perspectives -139-
Short curriculum vitae -143-
Supplementary material -145-

List of Tables

Table	Short description	Pag
1.1	Means and number of records for the monitored traits	-39
1.2	(Co)variances structures	-42
1.3	Fitting information using Akaike information criteria (AIC)	-47
1.4	Decomposition of variance for the structures from group 2	-52
2.1	Means and number of records for the monitored traits	-64
2.1	Phenotypic variance and repeatability of traits conditioning acquisition and partition of energy at different states of the reproductive rabbit-female cycle	-67
2.2	Within-trait correlations for the traits conditioning acquisition and partition of energy of the reproductive rabbit female	-68
2.3	Permanent and residual correlations among traits	-69
3.1	Ingredients and chemical composition of experimental diets	-85
3.2	LSmeans and standard errors of the main effects on feed intake, perirenal fat thickness, milk yield and litter weight	-89
3.3	Effect of genetic type, energy source and time control on plasma concentration of glucose, β-OH-butyrate, non-esterified fatty acids and leptin	-94
4.1	Effect of genetic type and energy source on female traits	-112
4.2	Effect of genetic type and energy source on litter traits	-115

List of Figures

Figure	Short description	Page
0.1	Possible reaction norms of two animals in arbitrary phenotypic and environmental units	-12-
0.2	Schematic view of genetically driven trajectories (targeted trajectory) homeorhetic control and homeostatic regulation	-15-
0.3	Schematic view of the effect of energy source on milk yield and body condition under the resource allocation framework	-18-
0.4	Relative priorities between current and future litters of females differently selected for litter size at weaning during	-20-
0.5	References related with energy requirements in function of the number of cycles evaluated in the experiment	-22-
1.1	Estimated evolution of phenotypic variance over time with different structures for feed intake, body weight and milk yield	-49-
1.2	Estimated phenotypic correlations with different structures for feed intake, body weight and milk yield	-50-
2.1	Individual trajectories of rabbit females across the reproductive cycle for each one of the evaluated traits	-71-
2.2	Estimated permanent value for each rabbit female and trait	-72-
2.3	Schematic view of the relation between nutrient partitioning and information provided by the estimated residuals with mixed models	-73-
2.4	Studentized residuals for two different traits from two rabbit females	-74-
3.1	Evolution of feed intake over the reproductive cycle and across reproductive cycles depending on genetic type and energy source	-91-
3.2	Evolution within a reproductive cycle of perirenal fat thickness depending on genetic type and energy source	-92-
3.3	Evolution of milk yield over the reproductive cycle and across reproductive cycles depending on genetic type and energy source	-92-
3.4	Plasma glucose and non-esterified fatty acids concentration throughout time depending on genetic type	-93-
3.5	Plasma β-OH-butyrate concentration throughout time depending on genetic type and energy source	-94-
3.6	Inner-average temperature per month of the farm and number of females that had their first parturition in the corresponding month	-98-
4.1	Percentage of adult weight at insemination for the subsequent RC depending on the genetic type	-113
4.2	Cumulated survival rate (%) at parturition in each reproductive cycle depending on genetic type	-113
4.3	Conception rate depending on genetic type and energy source	-114
4.4	Offspring survival rate during lactation in each reproductive cycle depending on genetic type and energy source	-114
4.5	Live history traits for each genetic type depending on energy source	-116

5.1 Relative priorities between current and future litter of females selected for different criteria -130
