# TABLE OF CONTENTS

I. INTRODUCTION .................................................................................................................. 28  
I.1 Starch as base material for biodegradable packaging applications ............ 30 
I.2. Cassava starch ........................................................................................................... 33 
I.3. Chitosan and its applications in biodegradable packaging ......................... 39 
I.4. Essential oils and their application into biodegradable films ................. 42 
I.5. Improving the functional properties of essential oils by encapsulation techniques .................................................................................................................. 56 
I. 6. Microencapsulation methods................................................................................. 69 
II. OBJECTIVES......................................................................................................................... 120 
III. RESULTS............................................................................................................................ 124 
   III.1. CHAPTER 1 
   Physical characterization of cassava starch – chitosan films obtained by compression molding ............................................................................................................. 128 
   III.2. CHAPTER 2 
   Thermoplastic cassava starch-chitosan films containing essential oils ........ 156 
   III.3. CHAPTER 3 
   Influence of liposome encapsulated essential oils on properties of chitosan films .......................................................................................................................... 180 
   III.4. CHAPTER 4 
   Release kinetics and antimicrobial properties of chitosan-essential oils films as affected by encapsulation within lecithin nanoliposomes ......................... 208 
   III.5. CHAPTER 5 
   Chitosan films containing encapsulated eugenol in alginate microspheres ... 227 
IV. GENERAL DISCUSSION.................................................................................................... 258 
V. CONCLUSION ..................................................................................................................... 270
### TABLES

**Table I.1** Summary of results obtained for cassava starch films obtained by different techniques (casting and thermoplastic processing)…………………………... 36

**Table I.2** Main constituents of cinnamon leaf and oregano essential oils and their wt. percentage range, as reported by several authors……………………………... 44

**Table I.3** Recent papers studying the effect of essential oils on CH films properties (Scanning Electron Microscopy (SEM), elastic modulus (EM, MPa), tensile strength (TS, MPa), elongation at break (E, %), water vapour permeability (WVP), oxygen permeability (OP), gloss and transparency……... 48

**Table I.4** Recent studies dealing with the effect of EOs addition on the antimicrobial activity of CH films or coating………………………………………... 52

**Table I.5** Advantages and disadvantages of wall material to encapsulation….. 62

**Table I.6** A representative list of encapsulated essential oils and other compounds with different methods for encapsulation…………………………….. 66

**Table I.7** Advantages and disadvantages of different microencapsulation technologies ……………………………………………………………………… 76

**Table 1.1.** Thermal properties of the films analyzed by TGA ($T_0$, $T_{max}$, % Mass loss over degradation). Mean values and standard deviation………………….. 137

**Table 1.2.** Thermal properties of films analyzed by DSC. Mean values and standard deviation…………………………………………………………………. 140

**Table 1.3.** Thickness, moisture content and water vapour permeability (WVP) of films equilibrated at 53% RH. Mean values and standard deviation……………….. 141

**Table 1.4.** Tensile properties (elastic modulus: EM, tensile strength: TS and deformation: E %, at break) of all films equilibrated at 53% RH after 1 and 5 week storage. Mean values and standard deviation……………………….. 143

**Table 1.5.** Lightness ($L^*$), chroma ($C^{*a}b$), hue ($h^{*a}b$), whiteness index (WI) and gloss at 60° after 1 and 5 week storage. Mean values and standard deviation................................................................................................................ 147

**Table 1.6.** The antimicrobial activity of the films on pork meat and stored 7 days at 10°C. Mean values and standard deviation........................................ 148
Table 2.1. Thermal properties of the films and essential oils (T₀, Tₘₐₓ, Mass loss during degradation). Mean values and standard deviation.

Table 2.2. Tensile properties (elastic modulus: EM, tensile strength: TS and elongation: E %, at break) of all films equilibrated at 53% RH after 1 week storage. Mean values and standard deviation.

Table 2.3. Thickness, water vapor permeability (WVP) and oxygen permeability (OP) of the films. Mean values and standard deviation.

Table 2.4. Lightness (L*), chroma (C*ₐb), hue (h*ₐb), whiteness index (WI) and gloss at 60°. Mean values and standard deviation.

Table 3.1. Density and ζ-potential of nanoliposome dispersions (ND) and film-forming dispersions (FFD). Mean values and standard deviation. Lec: lecithin, Eu: eugenol, CLEO: cinnamon leaf essential oil, CH: chitosan.

Table 3.2. Mass fraction of eugenol in the dried films (mg/g film solids), extracted in the dried film and initially incorporated, and percentage retention (extracted with respect to the initially added). Lec: lecithin, Eu: eugenol, CLEO: cinnamon leaf essential oil, CH: chitosan.

Table 3.3. Thickness and tensile parameters (elastic modulus, EM; tensile strength, TS; percentage elongation, %E) of the films. Mean values and standard deviation. Lec: lecithin, Eu: eugenol, CLEO: cinnamon leaf essential oil, CH: chitosan.

Table 3.4. Water content (Xₜ), water vapor permeability (WVP) and solubility (g of solubilized solids/100 g of initial solids) of the films. Mean values and standard deviation. Lec: lecithin, Eu: eugenol, CLEO: cinnamon leaf essential oil, CH: chitosan.

Table 3.5. Lightness (L*), chroma (C*ₐb), hue (h*ₐb) and gloss (60°) of the films. Mean values and standard deviation. Lec: lecithin, Eu: eugenol, CLEO: cinnamon leaf essential oil, CH: chitosan.

Table 3.6. Onset temperature (T₀) and maximum degradation rate temperature of the films. Mean values and standard deviation. Lec: lecithin, Eu: eugenol, CLEO: cinnamon leaf essential oil, CH: chitosan.
Table 3.7. Escherichia coli counts in liquid (TSA Broth) and solid media (TSA Agar) at 10ºC. Mean values ± standard deviation Lec: lecithin, Eu: eugenol, CLEO: cinnamon leaf essential oil, CH: chitosan. ng: no growth ................................................................. 201

Table 3.8. Listeria innocua counts in liquid (TSA Broth) and solid media (TSA Agar). Mean values ± standard deviation Lec: lecithin, Eu: eugenol, CLEO: cinnamon leaf essential oil, CH: chitosan. ng: no growth .......... 202

Table 4.1. Total migration (10 days, 20ºC) of material from the films and eugenol extracted and retained in methanol after 24 hours. Mean values and standard deviation ......................................................... 216

Table 4.2. Apparent diffusivity (D) and parameters of Peleg’s model: amount of active compound released at equilibrium in the simulant (M∞) and its release rate (1/k1), and maximum release ratio (M∞/M0) mass of active released at equilibrium in the simulant related to the initial mass of the active in the film expressed with respect to the amount determined by methanol extraction (1) or by acetic acid extraction (2) ........................................................................... 218

Table 4.3. Total specific migration of eugenol (mg eugenol/g meat) from the films in meat samples stored at 10ºC. Mean values and standard deviation, in brackets ................................................................. 220

Table 5.1. Density, pH and ζ-potential of the dispersions an emulsion used to prepare the microspheres. Mean values and standard deviation ................................................................. 238

Table 5.2. Elastic modulus (EM), tensile strength (TS), elongation at break (%E), water vapor permeability (WVP), oxygen permeability (OP) and moisture content. Mean values and standard deviation. ......................................................... 240

Table 5.3. Lightness (L*), chroma (C*a,b), hue (h*ab), whiteness index (WI) and internal transmittance (Ti) at 450 nm. Mean values and standard deviation ...... 241

Table 5.4. Parameters of Peleg’s model: amount of eugenol released from CHEU at equilibrium in the simulant (M-) and its release rate (1/k1), and maximum release ratio (M∞/M0): mass of active released at equilibrium in the simulant related to the initial mass of the active in the film (expressed with respect to the theoretical incorporated amount (1) and with respect to the amount determined by acetic acid extraction (2)) ......................................................... 245

Table 5.5. Diffusion coefficient (D) and parameters of the Korsmeyer–Peppas model (rate constant (k) and diffusional exponent (n)) ......................................................... 245
