

Index

Chapter 1: Introduction.....	1
1.1. Hydrogen: evolution, properties, and economy.	1
1.1.1. Hydrogen applications and economy.....	2
1.1.2. Hydrogen colors and production techniques	4
1.2. Process electrification	9
1.2.1. Direct electrification.....	9
1.2.2. Electrochemical pathways	11
1.2.3. Plasma pathways.....	12
1.3. Solid oxide materials	13
1.3.1. Catalytic properties	13
1.3.2. Electric properties	14
1.3.2.1. Defect theory	16
1.3.3. Dielectric properties	29
1.1. Thermochemical looping	32
1.1.1. Microwave-assisted thermochemical looping	36
1.2. Microwave reactors.....	39
1.2.1. Dielectric heating	40
1.2.2. Microwave applicators.....	41
Chapter 2: Context and scope of the thesis.....	52
Chapter 3: Methodology.....	56
3.1. Material preparation.....	56
3.1.1. Solid-state reaction.....	56
3.1.2. Coprecipitation method	57
3.2. Physicochemical characterization of materials.....	58
3.2.1. Polycrystalline X-ray Diffraction (XRD)	58
3.2.2. Surface area determination by Brunauer-Emmett-Teller theory (BET).....	58
3.2.3. X-ray photoelectron spectroscopy (XPS)	61
3.2.4. Ultraviolet-visible spectroscopy (UV-Vis).....	62
3.2.5. Mass spectrometry	65
3.2.6. Field Emission Scanning Electron Microscopy (FESEM)	66
3.2.7. Energy Dispersive Spectroscopy (EDS)	68

3.3.	Electrochemical and dielectric characterization of materials	69
3.3.1.	Conductivity measurements by Direct Current (DC).....	69
3.3.2.	Dielectric characterization by in-situ Microwave Cavity Perturbation Technique (MCPT)	71
3.4.	Microwave set-ups.....	73
3.4.1.	Microwave-assisted fixed bed reactor.....	73
Chapter 4: Modulating Redox Properties of Ionic Conductors by Microwave Radiation.....		78
4.1.	Introduction.....	78
4.2.	Experimental methods	79
4.2.1.	Materials preparation.....	79
4.2.2.	Physicochemical characterization.....	79
4.2.3.	Microwave driven material reduction	79
4.3.	Results	81
4.3.1.	The microwave-induced redox phenomenon on solid-state materials.....	81
4.3.2.	Cyclability of the microwave-induced redox process	83
4.3.3.	Effect of power, temperature, and pO ₂ in the CGO material activation.....	86
4.3.4.	Particle size effect.....	88
4.4.	Conclusion	94
Chapter 5: Tailoring Ceria Properties for H₂ Production in MW-Driven Redox Cycles.....		97
5.1.	Introduction.....	97
5.2.	Experimental methods	98
5.2.1.	Materials preparation.....	98
5.2.2.	Physicochemical characterization.....	99
5.2.3.	Measuring the conductivity of the sample by MCPT and DC	100
5.2.4.	Material's polarizability at low temperature	100
5.2.5.	Hydrogen production by microwave-driven water-splitting.....	101
5.3.	Results	101
5.3.1.	Influence of lattice properties in the materials' polarizability.....	101
5.3.2.	Effect of bandgap energy on induction temperature (<i>T_i</i>)	107
5.3.3.	Influence of lattice properties and microwave interaction on electrical conductivity.	112
5.3.4.	Impact of kinetic properties in microwave-driven water splitting	116

5.4.	Discussion	125
5.5.	Conclusion	129
Chapter 6: Tuning Lanthanum-Doped Ceria for H₂ Production via MW-Assisted Redox Cycles		134
6.1.	Introduction	134
6.2.	Experimental methods	135
6.2.1.	Materials preparation	135
6.2.2.	Physicochemical characterization.....	135
6.2.3.	Measuring the conductivity of the sample by MCPT and DC	136
6.2.4.	Material's polarizability calculation.....	136
6.2.5.	Hydrogen production by microwave-driven water-splitting.....	137
6.3.	Results	137
6.3.1.	Materials characterization	137
6.3.2.	Influence of lanthanum concentration on materials' polarization capacity ...	141
6.3.3.	Effect of lanthanum concentration on materials' induction temperature.....	144
6.3.4.	Effect of kinetics and oxygen content on the water splitting process.....	150
6.3.5.	Influence of surface area on hydrogen production.....	156
6.4.	Conclusion	161
Chapter 7: The Reductive Power of Microwaves: New Perspectives and Applications.....		165
7.1.	General introduction	165
7.2.	Microwave-assisted oxygen-selective sorbents (OSS)	165
7.2.1.	Introduction	165
7.2.2.	Experimental methods	168
7.2.2.1.	Material preparation.....	168
7.2.2.2.	Physicochemical characterization.....	168
7.2.2.3.	Conductivity measurements.	169
7.2.2.4.	Microwave-assisted reduction measurements.....	169
7.2.3.	Results	170
7.2.3.1.	Materials characterization	170
7.2.3.2.	Impact of the manganese content on redox capacity.....	172
7.2.3.3.	Manganese doped CaTiO ₃ as oxygen-selective sorbent (OSS)	177
7.2.3.4.	Stability and cyclability of CTM82 as oxygen-selected sorbent	183
7.2.4.	Conclusion	186

7.3.	Microwave-assisted exsolution.....	187
7.3.1.	Introduction.....	187
7.3.2.	Experimental methods	189
7.3.2.1.	Material preparation.....	189
7.3.2.2.	Microwave-driven reduction.....	189
7.3.2.3.	Physicochemical characterization.....	190
7.3.3.	Results	191
7.3.3.1.	Microwave-driven exsolution	191
7.3.4.	Conclusion	201
Chapter 8: Conclusions and remarks.....		208
