Preface	1
I High-energy neutrino astronomy and the ANTARES telescope	5
1 Astroparticle physics and neutrino astronomy	7
1.1 Brief history of neutrinos	8
1.2 The origin of cosmic neutrinos	9
1.3 Cosmic neutrino sources	12
1.4 Detection principle	14
1.5 Neutrino telescopes	17
2 The ANTARES telescope	21
2.1 Data acquisition	22
2.2 Monte Carlo simulations	29
2.3 Event reconstruction strategies	33
II New reconstruction method for ANTARES single-line events based on Machine Learning: N-fit	37
3 Machine Learning introduction and N-fit method development	39
3.1 Deep Learning built-in blocks	40
3.2 Dataset preprocessing	46

3.3	<i>N</i> -fit modular organization	47
4	Performance and first use case	57
4.1	Direction reconstruction improvement	57
4.2	Transfer learning applications	62
4.3	Robustness tests	67
4.4	First use case	70
III	Dark Matter searches in the Sun with ANTARES	77
5	Dark Matter phenomenology	79
5.1	Evidences for the existence of Dark Matter	80
5.2	Dark matter candidates and experiments	84
5.3	The Sun as source of neutrinos from WIMP annihilations	89
6	Analysis methodology	93
6.1	Extended maximum likelihood method	95
6.2	Probability density functions and pseudo-experiments	97
6.3	Test statistic and sensitivity computation	99
6.4	Detector response	101
6.5	Neutrino flux and WIMP-nucleon Cross-Section computation	104
7	Implementation and results	107
7.1	Ingredients	109
7.2	Pseudo-Experiments implementation	116
7.3	Sensitivities and final cuts	119
7.4	Unblinding: results and limits	124
	Conclusions	131
	Summary of Contributions	131
	Discussion	132
	Future Prospects	133
	Concluding Remarks	134
	Bibliography	135
	Appendix	159
A	Brief mathematical demonstrations	161
A.1	Differential equation solution for the number of WIMPs in the Sun	162

A.2	Demonstration that $\mathcal{N} = N_{tot}$ in the extended likelihood approach	164
A.3	Demonstration that a change in the TS variable does not affect the results	166

B Result tables 169

B.1	Conversion factors	170
B.2	Sensitivities	173
B.3	Limits	182
