

Index

Resumen	9
Resum	11
Summary	13
Glossary.....	15
Introduction	17
Multicellular organisms development and signals	17
Self-regeneration problems in adult organisms.....	21
Signals that regulate cell fate	26
Ion mediated signalling in stem cells.....	31
Objectives	37
Chapter I.....	39
Zinc enhances myogenic differentiation through Akt activation via zinc transporter Zip7	39
Introduction.....	40
Materials and methods	42
Cell culture	42
Live dead (cytotoxicity) and proliferation (total cell density and BrdU) assays	42
Myogenic differentiation visualisation.....	43
Analysis of intracellular Zn ²⁺	44
Gene expression analysis by quantitative real time PCR	44
Zip7 expression and Akt activity.....	45
RNA interference (RNAi) experiments.	45
Statistical analyses.....	46
Results.....	46
Zn ²⁺ increases myoblasts viability and proliferation.....	46
Zn ²⁺ enhances myoblast differentiation.....	48
Intracellular Zn ²⁺ increases in differentiated myoblasts	51

Expression of subcellular Zip7 transporter regulates Akt activity.....	54
Effects of Zip7 silencing in myoblasts	56
Silencing of Zip7 alters intracellular Zn ²⁺ content.....	58
Effects of Zip7 silencing in myotubes	59
Discussion	61
Chapter II	69
Zinc maintains embryonic stem cells pluripotency and multilineage differentiation potential via Akt activation	69
Introduction	70
Materials and methods	72
ESCs culture and embryoid bodies formation.....	72
ESCs intracellular Zn ²⁺ homeostasis.....	73
Immunofluorescence, staining, and histology methods.	73
RNA interference (RNAi).....	74
Akt inhibition experiments.	74
Western Blot analysis.....	74
Gene expression analysis by quantitative real time PCR	75
Statistical analyses.....	76
Results.....	76
Zn ²⁺ effects on ESCs viability and proliferation	76
Zn ²⁺ promotes ESCs self-renewal	77
Zn ²⁺ maintain ESCs stemness activating Zip7 transporter and Akt signalling transduction pathway	83
Zn ²⁺ -mediated activation of Akt is strongly associated with intra-nuclear presence of transcription factor Oct4	89
Zn ²⁺ maintains ESC pluripotency in long-term cultures	91
Zn ²⁺ maintains ESC differentiation capacity after long-term cultures.....	94
Zn ²⁺ maintains a stable ESCs pluripotent state after long-term cultures .	100
The combination of LIF and Zn ²⁺ strongly increases LIF effects.....	103
Discussion	105
Chapter III	109
Lithium inhibits GSK3β, activating β-catenin and promoting ESCs differentiation towards hemogenic endothelium.....	109

Introduction	110
Materials and methods	112
ESCs culture	112
ESCs viability and proliferation in presence of different concentrations of lithium	112
ESCs differentiation experiments	113
Hemogenic endothelium differentiation experiment	113
Immunofluorescence and stains	113
Western Blot experiments	114
Quantitative real time PCR	115
Statistical analyses	116
Results	116
High concentrations of Li ⁺ are toxic for ESCs and can reduce cell proliferation	116
Li ⁺ inhibits GSK3 β activity without affecting ESCs spontaneous differentiation	118
Li ⁺ -mediated inhibition of GSK3 β increases over time and enhances β -catenin expression and nuclear translocation	121
Nuclear accumulation of β -catenin activates Brachyury/T and Cdx2 expression	123
High concentration of Li ⁺ leads to ESCs differentiation to Sca1 and CD31 positive endothelial cells	124
ESCs-derived hemogenic endothelial cells can be matured to obtain HSCs	127
Discussion	130
Discussion	133
Conclusions	139
Contributions	141
References	145
