1 Introduction **1**

1.1 Motivation 2

1.2 Objectives 8

1.3 Organization of this thesis 10

2 State of the Art **11**

2.1 Introduction 12

2.1.1 Real-time systems 12

2.2 Scheduling policies in real-time systems 14

2.2.1 Static schedulers 16

2.2.2 Dynamic schedulers 17

2.2.2.1 Fixed priority based schedulers 17

2.2.2.2 Dynamic priority based schedulers 19

2.2.3 Multiprocessor scheduling 22

2.3 Partitioned systems 27

2.4 Hierarchical scheduling 30

2.5 Mixed criticality systems 32

2.6 Energy savings policies 35

2.7 Virtualization 42

2.8 Certification aspects in critical real-time systems 45

2.9 Conclusions 49

3 Generation of offline plans in real-time partitioned systems. 51
3.1 Introduction and objectives . . . 53
3.2 Model and notation . . . 55
3.2.1 Supply bound function . . . 56
3.3 Schedulable CPU supply functions . . . 59
3.3.1 Schedulable $sbf_\tau(t)$ based on G(t) . . . 59
3.3.1.1 Example of $gsbf_\tau(t)$ use . . . 65
3.3.2 Schedulable $sbf_\tau(t)$ based on $dbf_\tau(t)$ . . . 66
3.3.2.1 Example of $msbf_\tau(t)$ use . . . 74
3.4 Schedulable areas . . . 77
3.4.1 ZONE 1: CPU supply R greater than $gsbf_\tau(t)$ and, consequently, $msbf_\tau(t)$ . . . 78
3.4.2 ZONE 2: CPU supply R between $msbf_\tau(t)$ and $gsbf_\tau(t)$ . . . 79
3.4.3 ZONE 3: CPU supply R less than $msbf_\tau(t)$ . . . 81
3.5 Schedulability analysis . . . 84
3.6 Experimental results . . . 90
3.6.1 Utilities of $msbf_\tau(t)$ applied to partitioned systems . . . 93
3.6.2 Comparison of the minimum CPU supply function with other similar methods . . . 95
3.7 Conclusions . . . 98

4 Energy saving techniques in partitioned systems 99
4.1 Introduction and objectives . . . 101
4.2 Assumptions and model . . . 102
4.2.1 Vestal model and MCS state of the art . . . 102
4.2.2 Task model proposed . . . 105
4.2.3 Power model . . . 108
4.3 Energy Efficient Partition Allocator . . . 109
4.3.1 Energy efficient partition allocation in non MCS . . . 109
4.3.1.1 Energy efficient partition allocation algorithm . . . 109
4.3.1.2 Example . . . 113
4.3.2 Energy efficient partition allocation in MCS . . . 114
4.3.2.1 Example . . . 116

4.4 Simulation process 119
4.4.1 Comparison of allocation methods in non MCS 120
4.4.2 Energy saving and performance loss in MCS 125
4.5 Practical application: Xoncrete 129
4.5.1 Introduction 129
4.5.2 Description of the previous state 129
4.5.3 Modifications in the tool 131
4.5.4 Use case 132
4.6 Theoretical energy characterization 144
4.6.1 Relation between time and frequency 146
4.6.1.1 Linear approximation 147
4.6.1.2 Non-linear approximation 147
4.6.2 Energy-Time-Frequency relation 148
4.6.3 Optimal energy consumption through mathematical analysis 150
4.6.3.1 Linear relation. 150
4.6.3.2 Non-linear relation. 154
4.6.3.3 Comparison between linear and non-linear approximation. 156
4.7 Conclusions 157

5 Conclusions **159**
5.1 Developments and Achievements 161
5.2 Future Work 164
5.3 Publications and Projects 166
5.3.1 Journals 166
5.3.2 International Conferences 167
5.3.3 National Conferences 168
5.3.4 Projects, Scholarships and Research Stay 169

Appendices **171**
A Supplementary calculation 173
