| Abstract | ix |
| Contents | xv |
| 1 General Introduction | 1 |
| 2 Riemann-Liouville and Caputo operators in mean square sense: solving a random linear fractional differential equation | 7 |
| 2.1 Introduction | 8 |
| 2.2 Preliminaries about mean square random calculus | 9 |
| 2.3 Mean square random fractional differential and integral operators | 15 |
| 2.4 Solving the random linear fractional differential equation by the mean square generalized Frobenius method | 21 |
| 2.5 Computing approximations of the mean, the variance, the covariance and the cross-covariance functions of the solution stochastic process | 29 |
| 2.6 Numerical examples | 33 |
| 2.7 Conclusions | 44 |
| 3 Solving high order random mean square fractional linear differential equations | 45 |
| 3.1 Introduccion | 46 |
| 3.2 Introducing a key class of random variables | 48 |
| 3.3 Mean square convergence of the random generalized power series solution | 53 |
| 3.4 Numerical examples | 63 |
| 3.5 Conclusions | 74 |

| | |
|--|-----|
| 4 A full probabilistic solution of the random linear fractional differential equation | 75 |
| 4.1 Introduction | 76 |
| 4.2 Main result: Computing approximations of the 1-PDF of the solution stochastic process. | 80 |
| 4.3 Numerical examples | 86 |
| 4.4 Conclusions | 91 |
| 5 Solving a random non-autonomous linear fractional differential equation | 93 |
| 5.1 Introduction | 94 |
| 5.2 Constructing a mean square convergent random generalized power series solution and approximating its main statistical properties | 94 |
| 5.3 Numerical examples | 99 |
| 5.4 Conclusions | 105 |
| 6 Solving high order random non-autonomous linear fractional differential equations: generalizing Airy differential equation | 107 |
| 6.1 Introduction | 108 |
| 6.2 Constructing the solution stochastic process | 109 |
| 6.3 Probabilistic properties of the solution stochastic process | 114 |
| 6.4 Approximating the probability density function via the Principle of Maximum Entropy | 118 |
| 6.5 Numerical examples | 121 |
| 6.6 Conclusions | 134 |
| 7 Mean square convergent numerical solutions of random fractional differential equations | 137 |
| 7.1 Introduccion | 138 |

| | |
|--|-----|
| 7.2 Relation between the random fractional differential and integral equations . . . | 139 |
| 7.3 Numerical approximations to the random fractional IVP. | 143 |
| 7.4 Error analysis | 144 |
| 7.5 Statistical moments of the numerical approximations | 147 |
| 7.6 Numerical examples | 149 |
| 7.7 Conclusions. | 159 |
| | |
| 8 Studying the evolution over the next few years of the meningococcal genogroup W carriers in Spain | 161 |
| 8.1 Introduction | 162 |
| 8.2 Lotka-Volterra competition model and SCS epidemiological transmission | 165 |
| 8.3 Probabilistic Fitting | 171 |
| 8.4 Results | 177 |
| 8.5 Conclusions. | 182 |
| | |
| 9 Modelling breast tumor growth by a randomized logistic model | 185 |
| 9.1 Introduction | 186 |
| 9.2 A randomized discrete logistic model. | 188 |
| 9.3 Data and their uncertainty. | 190 |
| 9.4 Statistical distribution of the model parameters. | 194 |
| 9.5 Procedure design | 196 |
| 9.6 Results | 198 |
| 9.7 Conclusions. | 203 |
| | |
| 10 A random computational procedure to recommend insulin and carbohydrates intakes to diabetic patients | 205 |
| 10.1 Introduction | 206 |
| 10.2 Model description | 209 |

CONTENTS

| | |
|---|-----|
| 10.3 Data and their uncertainty | 211 |
| 10.4 Procedure design | 211 |
| 10.5 Results | 218 |
| 10.6 Analysis | 223 |
| 10.7 Conclusion. | 225 |
| | |
| 11 General Conclusions | 227 |
| | |
| Bibliography | 229 |
