Abstract	ix
Resumen	xi
Resum	xiii
Contents	xvi
1 Introduction	1
1.1 Robotic rehabilitation for lower limb	1
1.2 Motivation and objectives of the thesis	6
1.3 Contribution of the thesis	8
1.4 Structure of the thesis	11
2 Singularities in parallel robots	13
2.1 Parallel robots	13
2.2 Kinematic analysis	17
2.3 Classification of singularities	19
2.4 Analysis of Type II singularities	22
2.5 Closeness measurement to Type II singularities	25
2.6 Methods for addressing Type II singularities	27
2.7 Discussion and Conclusions	31
3 Analysis of Type II singularities	33
3.1 Motion decomposition in a non-redundant parallel robot	34
3.2 Detection of Type II singularities based on Output Twist Screws	35

3.3	Closeness to Type II singularities based on Output Twist Screws	37
3.4	Experimental procedure to set the limit of proximity to Type II singularities	39
3.5	Case Study: five bars mechanism	40
3.6	Case Study: Parallel robot for knee rehabilitation	45
3.7	Trajectories with assembly change points	61
3.8	Discussion and Conclusions	65
4	Algorithms to release and avoid Type II singularities	67
4.1	Algorithm to release a parallel robot from Type II singularities	68
4.2	Type II singularity avoidance algorithm	79
4.3	Discussion and Conclusions	89
5	Compliant control and Type II singularity avoidance for knee rehabilitation	93
5.1	Force/position control strategies	94
5.2	Control unit and sensors	99
5.3	Admittance controller complemented with singularity avoidance algorithm .	104
5.4	Discussion and Conclusions	116
6	Conclusions and future research	117
6.1	Conclusions	117
6.2	Future research	122
6.3	Publications	125
	References	129
