3.2 Changes to “Full” Installed Files.....	5

## 1. Purpose

This document describes considerations to make when upgrading to Texas Instruments Z-Stack™ version 2.4.0, discussing changes made since the 2.3.1 release of Z-Stack. Z-Stack now supports ZigBee's Over-The-Air Upgrade (OTA) feature for inter-operable firmware replacements. Additionally, this release introduces support for a TI 32-bit ARM Cortex-M3 processor, the Stellaris LM3S9B96.

This document deals with the eight “core” and “full” Z-Stack installation packages listed below. “Core” packages include the latest Z-Stack files and libraries along with one simple sample application. “Full” packages include all components of the associated “core” package, along with additional sample applications, additional documentation, Z-Tool, and ZOAD.

- *ZStack-CC2530-2.4.0.exe* - “Core” package for SmartRF05EB + CC2530EM
- *ZStack-EXP5438-2.4.0.exe* - “Core” package for MSP-EXP430F5438 + CC2520EM
- *ZStack-LM9B96-2.4.0.exe* - “Core” package for LM3S9B96 + CC2520EM
- *ZStack-MSP2618-2.4.0.exe* - “Core” package for SmartRF05EB + MSP2618 + CC2520EM
- *ZStack-CC2530-2.4.0-1.4.0.exe* - “Full” package for SmartRF05EB + CC2530EM
- *ZStack-EXP5438-2.4.0-1.4.0.exe* - “Full” package for MSP-EXP430F5438 + CC2520EM
- *ZStack-LM9B96-2.4.0-1.4.0.exe* - “Full” package for LM3S9B96 + CC2520EM
- *ZStack-MSP2618-2.4.0-1.4.0.exe* - “Full” package for SmartRF05EB + MSP2618 + CC2520EM

## 2. Summary of Changes

### 2.1 ZStack-2.4.0 Changes

This section summarizes changes to Z-Stack that are observed when upgrading from version 2.3.1 to 2.4.0.

#### 2.1.1 Over-The-Air Upgrade

Z-Stack now supports the ZigBee OTA Upgrade Cluster. OTA provides an inter-operable mechanism to upgrade the firmware on Z-Stack devices over an existing ZigBee network. Two sample applications in the “full” installers provide “out-of-the-box” configurations to demonstrate OTA – *SampleSwitchOta* and *SE SampleApp*. Refer to the “Z-Stack OTA Upgrade User's Guide” for detailed instructions on using this feature.

#### 2.1.2 Project File Changes

Z-Stack project files have been simplified to provide default support for ZigBee-Pro – explicit configurations for non-Pro devices have been removed. As part of this change, the ZIGBEEPRO compile option has been placed in the *f8wConfig.cfg* file and removed from the *Compiler->Preprocessor->Defined symbols* dialog box of the project file. This causes builds for all supplied sample applications to default to usage of ZigBee-Pro. Users who want to create non-Pro devices will need to make two simple changes to their project: (1) comment-out the ZIGBEEPRO option in *f8wConfig.cfg*, and (2) change to the corresponding non-Pro library – remove the *-Pro* part of the default library name found in the *Linker->Extra Options* dialog box.

#### 2.1.3 OSAL Enhancements

Enhancements have been made to OSAL functionality as described below. These new features were developed for use in the Z-Stack system but are also available for application program usage. Refer to the “OSAL API” document for details on the use of OSAL features and functions.

##### 2.1.3.1 Task Processing

Z-Stack continues to use a call to the function *osal\_start\_system()*, at the end of the system start-up process, to enter an infinite loop that provides task processing for the OSAL environment. In the 2.4.0 release, the task processing logic has been moved to a new function, *osal\_run\_system()*, that is called from the infinite loop in *osal\_start\_system()*. This permits the user run OSAL tasks, one at a time, if using an alternate OS scheduler and not using the default start-up call to *osal\_start\_system()*.

##### 2.1.3.2 Memory Manager

The Z-Stack dynamic memory manager, *OSAL\_Memory.c*, has been improved to perform better with 8-bit, 16-bit, and 32-bit processors, to avoid wasted RAM on smaller *halDataAlign\_t* sizes. In addition, the “small-block bucket”

implementation has been enhanced so that long-lived items are placed at the bottom of the bucket to avoid searching during allocation and coalescing. Refer to the “Heap Memory Management” document for dynamic memory details.

### 2.1.4 Performance Improvements

Changes to ZStack-2.4.0 have been made to improve stability and performance in dense and higher traffic networks. See the README document accompanying the installation for a summary of improvements for this release.

#### 2.1.4.1 Sleep Time

In past Z-Stack releases, End-Device sleep time was limited to slightly less than 21 seconds, due to OSAL timer use of 16-bit variables to count 320 uSec MAC timer interrupts. This problem has been resolved so that End-Devices can now sleep for the maximum OSAL timer period – 65.535 seconds.

#### 2.1.4.2 Radio Sensitivity

The default value of MAC\_RADIO\_RECIVER\_SENSITIVITY\_DBM has been updated to reflect the most recent characterized values in the data sheet. This improves the quality of calculated LQI values.

#### 2.1.4.3 CC2530 Optimization

For Z-Stack packages that support CC2530-based platforms, the default compiler optimization settings have been changed to disable the *Code Motion* option. This provides for better debugging, while producing slightly larger code.

### 2.1.5 Compiler Changes

IAR toolsets for the CC2530 and MSP430 platforms have been changed since the ZStack-2.3.1 release to take advantage of the latest improvements in the IDE, compilers, linkers, debuggers, etc. All ZStack-2.4.0 development and testing was performed with these newer tools, so it is recommended that users do an upgrade to these versions.

#### 2.1.5.1 CC2530

Z-Stack-2.4.0 packages that support CC2530-based platforms have been upgraded to use the IAR EW8051 v7.60 Embedded Workbench toolset. The Z-Stack-2.3.1 release used v7.51 - note that ZStack-2.4.0 projects will not build properly with the v7.51A toolset – developers should upgrade to the v7.60 version.

#### 2.1.5.2 MSP430

Z-Stack-2.4.0 packages that support MSP430-based platforms (MSP2618 and EXP5438) have been upgraded to use the IAR EW430 v5.10.6 Embedded Workbench toolset. The Z-Stack-2.3.1 release used v5.10.4 - note that ZStack-2.4.0 projects will build properly with the v5.10.4 toolset, but developers are encouraged to upgrade to v5.10.6.

## 3. Changes to Installed Files

This section lists file changes to Z-Stack installations that result when upgrading from version 2.3.1 to 2.4.0. Note that the LM3S9B96 platforms are not included here since version 2.4.0 is their initial release. Refer to tables in Sections 3.1 and 3.2 for changes to the Z-Stack “core” and “full” installers, respectively. Pay particular attention to items listed with **New** or **Removed** in the **Change** column. File folder updates are indicated when there is no entry in the **File** column. Making changes to existing project files (\*.ewp,\*.ewd,\*.eww) can be done with the Embedded Workbench IDE or by editing the XML files directly.

### 3.1 Changes to “Core” Installed Files

The following “core” Z-Stack files have been changed since the v2.3.1 release:

File	Location	Change
hal_assert.c	...\Components\hal\common	Modified
hal_drivers.c	...\Components\hal\common	Modified
hal_drivers.h	...\Components\hal\include	Modified
hal_dma.h	...\Components\hal\target\CC2530EB	Modified
hal_flash.c	...\Components\hal\target\CC2530EB	Modified
hal_key.c	...\Components\hal\target\CC2530EB	Modified
hal_ota.c	...\Components\hal\target\CC2530EB	New
hal_ota.h	...\Components\hal\target\CC2530EB	New
hal_sleep.c	...\Components\hal\target\CC2530EB	Modified

hal_ivec.s43	...\Components\hal\target\MSP5438CC2520	Modified
hal_key.c	...\Components\hal\target\MSP5438CC2520	Modified
