

Broadcasting in 4G mobile broadband networks and its evolution towards 5G

Table of contents

1. Introduction
 - 1.1. Background
 - 1.1.1. Broadcasting in mobile networks
 - 1.1.2. eMBMS: the LTE Broadcast mode
 - 1.1.3. The challenges of mobile broadcasting beyond 4G
 - 1.2. State of the art analysis
 - 1.2.1. Performance evaluation of eMBMS
 - 1.2.2. eMBMS delivery of streaming and download services
 - 1.2.3. eMBMS for vehicular communications
 - 1.2.4. Cooperation between mobile broadband and broadcast networks
 - 1.3. Problem formulation
 - 1.4. Objectives and Thesis scope
 - 1.5. Research methodology
 - 1.6. Outline of the Thesis and main contribution
 - 1.7. List of publications
2. eMBMS system description and performance evaluation
 - 2.1. System description
 - 2.1.1. Network architecture
 - 2.1.2. eMBMS services and use cases
 - 2.1.3. Radio protocol architecture
 - 2.1.4. Physical layer configuration
 - 2.1.5. eMBMS scheduling
 - 2.1.6. eMBMS standard evolution
 - 2.2. Performance evaluation
 - 2.2.1. eMBMS physical layer limitations
 - 2.2.2. Simulation assumptions
 - 2.2.3. Effect of MBSFN area size on eMBMS system performance
 - 2.2.4. Application of MIMO for mobile broadcast transmissions
 - 2.3. Conclusions
3. Optimum delivery of eMBMS services
 - 3.1. Forward error correction in eMBMS
 - 3.1.1. Raptor AL-FEC family codes
 - 3.1.2. Streaming and file download use cases
 - 3.2. Delivery of streaming services
 - 3.2.1. Simulation assumptions
 - 3.2.2. Simulation results
 - 3.3. Delivery of file download services
 - 3.3.1. File download service delivery procedures
 - 3.3.2. Conventional file Delivery
 - 3.3.3. Hybrid approach
 - 3.4. Conclusions

4. Use of eMBMS for vehicular safety applications
 - 4.1. Vehicular communications for C-ITS
 - 4.1.1. ITS communication architecture
 - 4.1.2. Applications and use cases
 - 4.1.3. Cooperative road safety applications
 - 4.2. Delivery of vehicular safety applications over LTE networks
 - 4.2.1. eMBMS architecture for vehicular safety services
 - 4.2.2. Functionality of the BM-SC/ITS server node
 - 4.2.3. Vehicular safety services configuration for eMBMS delivery
 - 4.2.4. Vehicular safety services scheduling for eMBMS delivery
 - 4.3. Simulation assumptions
 - 4.3.1. Motorway scenario
 - 4.3.2. Configuration parameters and assumptions
 - 4.3.3. Vehicle safety data traffic models
 - 4.4. Simulation results
 - 4.4.1. Performance metrics
 - 4.4.2. CA application analysis
 - 4.4.3. RHW application analysis
 - 4.5. Cost analysis
 - 4.5.1. Cost modeling and assumptions
 - 4.5.2. Cost for CA applications
 - 4.6. Conclusions
5. Evolution of mobile broadcasting towards 5G
 - 5.1. Evolution of mobile communications and terrestrial broadcasting standards
 - 5.1.1. Mobile industry: evolution towards the future 5G system
 - 5.1.2. Broadcasters: evolution towards a global terrestrial standard
 - 5.2. First attempts for the mobile broadband-broadcast cooperation
 - 5.2.1. Technical approaches for 3GPP and DVB cooperation
 - 5.2.2. LTE Broadcast as ATSC 3.0 physical layer
 - 5.3. Challenges for a future mobile converged network
 - 5.3.1. Spectrum usage: from a problem to a solution
 - 5.3.2. New opportunities and attractive business models
 - 5.3.3. Requirements for successful convergence
 - 5.4. Conclusions
6. Conclusions and future work
 - 6.1. Concluding remarks
 - 6.2. Evolution of broadcasting towards 5G
 - 6.3. Future research issues
- A. Description of simulators
 - A1. Link-level simulator
 - A.1.1. Simulator structure
 - A.1.2. Channel modeling in link-level simulations
 - A.1.3. Transport block sizes modeling
 - A2. System-level simulator
 - A.2.1. Simulator structure
 - A.2.2. Network layout and equipment parameters
 - A.2.3. Channel modeling in system-level simulations

A.2.4. Mobility model

A.2.5. Link measurement modeling

A.2.6. Link abstraction models
