

CONTENTS

1	INTRODUCTION	1
1.1	Motivation	1
1.2	The successful trilogy	11
1.3	Some remarks on the approach to discover novelties	14
1.4	Road map	19
1.4.1	Problem statement and formalization	19
1.4.2	Proposed algorithmic solution	22
1.4.3	Experimentation and results	23
1.4.4	Conclusions and future work	24
1	Problem Statement and Formalization	25
2	SOME APPLICATION DOMAINS	27
2.1	Text segmentation	28
2.2	Part of speech tagging	29
2.3	Text chunking	29
2.4	(Monotone) Automatic translation	30
2.5	Spoken language understanding	32
2.6	Ambiguous keyboards, predictive text	33
2.7	Handwritten text recognition	37
2.8	Speech	41
2.9	Summary and some conclusions	49
2.9.1	Underlying representation	50
2.9.2	Preprocessing	52
2.9.3	Ambiguous front-ends and the pipeline problem	52
3	SOME PROBLEM TYPES RELATED TO SEQUENCES	57
3.1	Some problem types	58
3.1.1	Sequence classification	59
3.1.2	Segment Classification	60
3.1.3	Joint classification	61
3.1.4	Segmentation and over-segmentation	62
3.1.5	Recognition	64
3.1.6	Parsing	64
3.1.7	Language modeling	65
3.1.8	Prediction/Forecasting	65
3.1.9	Translation	65
3.1.10	Alignment	66
3.1.11	KWS, indexing, querying by example	69
3.1.12	Unsupervised term discovery	72
3.1.13	Filtering/Denoising and Smoothing	73
3.1.14	Summarization	73
3.1.15	Joint Segmentation and Classification	74
3.2	Some extensions	80
3.2.1	Several input sequences	80
3.2.2	Interactive systems	82

3.3	Limitations, how to face them, new proposal	87
3.4	Questionnaire when faced with a new problem	91
3.5	Analysis and evaluation measures	93
3.5.1	Quality assessment	96
3.5.2	Performance	99
3.5.3	Interaction	100
3.5.4	Other measures	102
3.6	Summary and some conclusions	102
4	MODELS	105
4.1	Some preliminary ML concepts	106
4.1.1	(Probabilistic) graphical models	115
4.2	Two stage generative model	130
4.2.1	Hierarchy for the second stage	133
4.2.2	Limitations, extensions and generalizations	137
4.3	Classical problems of two stage generative models	141
4.3.1	Probability of observation	142
4.3.2	Decoding	144
4.3.3	Model estimation	145
4.4	Some alternative models	146
4.4.1	Relationship with Dynamic Graphical Models	146
4.4.2	Fixed dimension feature segments	150
4.4.3	Estimation of frame-wise segment posteriors	155
4.4.4	Graph transformer networks	160
4.4.5	Some non-probabilistic frameworks	163
4.5	Summary and some conclusions	165
5	RECOGNITION, DECODING, PARSING, TRANSLATION	167
5.1	Introduction	167
5.2	Recognition, parsing, decoding	170
5.3	Weighted languages and semirings	172
5.4	Some formalisms	177
5.4.1	Formal/generative grammars	177
5.4.2	Finite state automata and transducers	184
5.4.3	Recurrent transition networks	187
5.5	Deriving the composition of a regular and a CF model	194
5.5.1	State-pair transducer composition	195
5.5.2	Extension to null-transitions	200
5.5.3	Extension to model reference transitions	209
5.5.4	Transformation to homogeneous epsilon form	221
5.6	Review of parsing approaches, decoders and algorithms	226
5.7	From composition to recognition/decoding	233
5.7.1	Acyclic inputs	234
5.7.2	Semiring specific optimizations	236
5.8	Summary and some conclusions	236
6	SEQUENCE MODELS	239
6.1	Probabilistic decompositions	242
6.1.1	Chain rule, clustering histories	243
6.1.2	Whole sentence LMs	244
6.1.3	Combining spans of the sequence	245
6.2	Assesment measures for LMs	246

6.3	Lexical units	249
6.3.1	Open vs closed lexicons	250
6.3.2	Most common types of lexical unit	250
6.3.3	Categories	253
6.3.4	Lexicon representation	254
6.4	LM combination	257
6.5	Dynamic capabilities	259
6.6	Common LM types	261
6.6.1	N-gram models	261
6.6.2	Weighted finite automata	265
6.6.3	Recurrent NN LMs	266
6.6.4	Other LM types	267
6.7	On semantics	268
6.8	Dealing with OOV words	269
6.9	LM Wrappers	271
6.9.1	Based on transducer composition	271
6.9.2	Changing lexical units	273
6.9.3	Partial/imperfect transcription	274
6.10	Some LM decoding features	275
6.10.1	Pruning, bounds, sub-lexicons, look-ahead and scales	276
6.10.2	LM histories, long-span LMs	278
6.11	Heterogeneous lattice-based LM	280
6.12	Summary and some conclusions	282
7	SEGMENT MODELS	285
7.1	Introduction	285
7.2	Overcoming the limitations of HMMs	288
7.2.1	Piecewise stationary	289
7.2.2	Frame independence assumption	290
7.2.3	Markov modeling of intra-segmental regions	292
7.2.4	Weak duration modeling of HMMs	293
7.3	Implicit vs explicit duration	293
7.3.1	Implicit duration models (and topologies)	294
7.3.2	Explicit duration models	299
7.4	Frame sequence emission	300
7.4.1	Intermediate levels of description	301
7.4.2	Trajectories, state-space and templates	303
7.5	Frame emission	304
7.5.1	From discrete features	304
7.5.2	From continuous features	305
7.5.3	Estimation from frame posteriors	307
7.5.4	A general scheme of frame emission	309
7.6	Context dependency	312
7.7	Allowing discriminative models	314
7.8	Some steps towards a general scheme of Segment Models	315
7.9	Summary and some conclusions	317

II Proposed Algorithmic Solutions 321

8	ARCHITECTURE	323
8.1	Dataflow architecture	324
8.2	DAG serialization protocol	326
8.3	Overview of dataflow components	331
8.3.1	Generic dataflow components	331
8.3.2	Domain specific components	332
8.4	Recognizer examples	334
8.4.1	One pass	334
8.4.2	Decoupled and semi-decoupled architectures	334
8.4.3	Semi-decoupled with feedback	337
8.4.4	Multipass recognizer	337
8.4.5	One-stage dag recognizer	339
8.4.6	Multimodal recognizer	339
8.4.7	Interactive assisted recognition	339
8.5	Summary and some conclusions	341
9	LM INTERFACES AND REPRESENTATIONS	343
9.1	Language Model Interface	344
9.1.1	n-gram interface	345
9.1.2	Automaton interface	345
9.1.3	RTN interface	353
9.1.4	Heterogeneous lattice LM interface	355
9.2	Count based n-gram implementations	355
9.3	Automata representation	360
9.3.1	Proposed “fan-out based” representation	361
9.3.2	Memory mapping	363
9.3.3	Proposed RTN representation	364
9.4	n-gram history manager	367
9.5	Neural Network LM	369
9.5.1	Fast evaluation with skipping NN LMs	370
9.5.2	Normalization constant estimation	373
9.5.3	NN LMs specialized for small vocabulary	376
9.5.4	“LM look-ahead” NN LMs	378
9.6	Assisted transcription representation	380
9.7	Summary and some conclusions	382
10	SEGMENT AND LEXICON ESTIMATORS	385
10.1	Introduction	386
10.2	Segment Estimator Interface	388
10.2.1	Incremental computation	389
10.2.2	Persistent and ephemeral operations	390
10.2.3	LM vs time conditioned decoders and Token Passing	394
10.2.4	Relationship with across-word context dependency	397
10.2.5	Relationship with pruning	400
10.3	Classical Viterbi implementations	400
10.3.1	Array swapping	402
10.3.2	Hash swapping	403
10.3.3	Reverse topological traversal	404
10.4	Dealing with null transitions and edition operations	405

10.5	Lexicon organization	408	
10.5.1	Linear/flat lexicon	409	
10.5.2	Prefix tree lexicon	412	
10.5.3	General lexicon networks (a.k.a. DAWG)	413	
10.6	Techniques to reduce the cost	415	
10.6.1	Active states pruning	415	
10.6.2	Fast-match look-ahead	422	
10.6.3	Variable frame rate and frame dropping	422	
10.6.4	External over-segmentation	424	
10.6.5	Information from previous passes	425	
10.6.6	Bundle-search and word-pair approximation	426	
10.6.7	Language Model Look-Ahead	428	
10.6.8	Submodel dominance recombination	433	
10.6.9	Other techniques to reduce the cost	434	
10.7	Detecting and emitting OOV words	438	
10.8	Specialized linear lexicon decoders	440	
10.9	Specialized tree lexicon decoders	450	
10.9.1	Model representation	450	
10.9.2	Representation of active states	453	
10.9.3	Different traversal possibilities	455	
10.9.4	Forward (root to leaves) traversal	457	
10.9.5	Decoding sub-word DAGs with error correction	462	
10.9.6	Backwards (leaves towards the root) traversal	464	
10.9.7	Combining Forward and Backwards	465	
10.9.8	Sub-word-centric decoding	466	
10.10	Lexicon Network specialized decoders	469	
10.10.1	Adapting forward traversal to DAGWs	469	
10.10.2	Adapting the sub-word-centric approach to DAGWs	471	
10.11	Summary and some conclusions	472	
11	DAG GENERATION	475	
11.1	From a sequence (seq_graph_gen)	477	
11.1.1	Basic model	478	
11.1.2	Pruning	482	
11.1.3	Using feedback information	483	
11.1.4	External over-segmentation	486	
11.1.5	Control automaton and across-word dependency	489	
11.1.6	Clustering of frame boundaries	493	
11.2	From another graph (graph_graph_gen)	495	
11.2.1	Over-segmenter information	498	
11.2.2	Feedback channel	501	
11.2.3	Edition operations	502	
11.3	Combining DAGs	504	
11.4	Summary and some conclusions	504	
12	DECODING	507	
12.1	Introduction	507	
12.1.1	Parallel, multi-threaded distributed recognizers	508	
12.2	Two stage decoder	509	
12.2.1	Internal components	510	
12.2.2	Behavior	511	
12.3	One Pass decoder	514	

12.3.1	One pass without dictionary look-ups	516
12.3.2	Dealing with silence/space models	518
12.4	Dealing with external over-segmentation	520
12.5	Summary and some conclusions	521

III Experimentation and results 523

13	LM EXPERIMENTATION	525
13.1	Some brief empirical support to our automata representation	525
13.2	Fall back skipping NN LMs	530
13.2.1	Emulating lower order n-gram NNLMs	530
13.2.2	Models in a machine translation system	533
13.3	NN LM softmax estimation with auxiliary LMs	535
13.4	Summary and some conclusions	536
14	HTR PREPROCESSING	539
14.1	Image cleaning	541
14.2	Tracking reference lines	544
14.2.1	Extraction and classification of “interesting points”	549
14.2.2	Active learning of classes of “interesting points”	550
14.3	Slope removal	551
14.4	Slant removal	553
14.4.1	Non-uniform slant removal	556
14.5	Size normalization	558
14.5.1	Vertical/Weight normalization	559
14.5.2	Width normalization	560
14.6	Feature extraction	563
14.6.1	Avoiding the feature extraction process	566
14.7	External word over-segmentation	566
14.8	Online preprocessing	569
14.8.1	Online preprocessing stages	569
14.8.2	Adapting the proposed offline preprocessing	571
14.8.3	Feature Extraction	571
14.8.4	External word over-segmentation	573
14.9	Summary and some conclusions	573
15	HTR EXPERIMENTATION	577
15.1	HTR with HMM/ANNs and count-based n-grams	579
15.1.1	Experimental setting (corpora, dictionary and LM)	579
15.1.2	Baseline experiments with HMM/GMMs	582
15.1.3	Experiments with HMM/ANNs	584
15.1.4	Analysis of results	588
15.2	HTR with HMM/ANN models and connectionist LMs	592
15.3	HTR by using CNNs for preprocessing	597
15.4	Lexicon-free recognition	599
15.5	Combining HMM/ANNs with holistic ANN	604
15.6	Some (isolated word) bimodal experiments	609
15.7	Summary, conclusions and future work	611

IV Conclusions and future work 615

16	CONCLUSIONS AND FUTURE WORK	617
16.1	Brief overview highlighting our contributions	619
16.1.1	Relating the first part	620
16.1.2	Relating the second part	622
16.1.3	Relating the third part	626
16.2	Some conclusions	627
16.2.1	Some expected critiques	629
16.2.2	Some final thoughts	630
16.3	Future Work	632
16.3.1	Related to decoding	632
16.3.2	Related to language modeling	634
16.3.3	Related to handwriting	635
16.4	Publications	636
16.4.1	Contributions derived from this thesis	636
16.4.2	Collaborations with other authors	638
16.4.3	Other publications	640

V Appendix 643

A	CORPORA	645
A.1	Text	645
A.1.1	Lancaster Olso Bergen (LOB)	645
A.1.2	One Billion Word Benchmark	646
A.2	Handwriting	646
A.2.1	IAMdb	647
A.2.2	IAM-OnDB	647
A.2.3	biMod-IAM-PRHLT	649
A.2.4	RIMES	649
