

## INDEX

### Summaries

Castellano .....	1
Valencià .....	4
English .....	7

### General Introduction ..... 11

Combination of physical and low-toxicity chemical postharvest treatments for integrated disease management of citrus fruit: a review

Reference: Updated versión of [Stewart Postharvest Review](#), 2010. Volume 6, Number 1, pp. 1-11.

### General Objectives ..... 47

### Chapter 1 ..... 51

Evaluation of sodium benzoate and other food additives for the control of citrus postharvest green and blue molds

Reference: *Postharvest Biology and Technology*. In press, doi: 10.1016/j.postharvbio.2015.12.022

### Chapter 2 ..... 79

Evaluation of brief potassium sorbate dips to control postharvest penicillium decay on major citrus species and cultivars

Reference: *Postharvest Biology and Technology* 2009, 52, 117-125.

### Chapter 3 ..... 107

Potassium sorbate residue levels and persistence in citrus fruit as detected by a simple colorimetric method

Reference: *Journal of Agricultural and Food Chemistry* 2009, 57, 3458-3463.

### Chapter 4 ..... 127

Short exposure to high CO<sub>2</sub> and O<sub>2</sub> at curing temperature to control postharvest diseases of citrus fruit

Reference: *Plant Disease* 2012, 96, 423-430.

### Chapter 5..... 147

Synergism between potassium sorbate dips and short gas exposures at curing temperatures for zero residue control of green and blue molds in citrus postharvest

Reference: *Crop Protection*. In press, doi: 10.1016/j.cropro.2015.12.005

### Chapter 6 ..... 159

Control of citrus postharvest decay by ammonia gas fumigation and its influence on the efficacy of the fungicide imazalil

Reference: *Postharvest Biology and Technology* 2011, 59, 85-93.

**Chapter 7 ..... 191**

Relative susceptibility of major commercial orange and mandarin cultivars to postharvest green and blue molds and its relationship with fruit quality attributes

Reference: Prepared for submission.

**General Discussion ..... 217**

**Conclusions ..... 225**
